## Acknowledgments

The Technical Reference Manual is maintained by the Public Utility Commission of Texas' independent evaluation, measurement, and verification (EM&V) team led by Tetra Tech. This version of the Texas Technical Reference Manual was primarily developed from program documentation and measure savings calculators used by the Texas Electric Utilities and their Energy Efficiency Services Providers (EESPs) to support their energy efficiency efforts, and original source material from petitions filed with the Public Utility Commission of Texas by the utilities, their consultants and EESPs such as Frontier Energy (TXu 1-904-705), ICF, CLEAResult, and Nexant. Portions of the Technical Reference Manual are copyrighted 2001-2017 by the Electric Utility Marketing Managers of Texas (EUMMOT), while other portions are copyrighted 2001-2018 by Frontier Energy. Certain technical content and updates were added by the EM&V team to provide further explanation and direction as well as a consistent structure and level of information.

## TRM Technical Support

Technical support and questions can be emailed to the EM&V project manager, [Lark.Lee@tetrattech.com](mailto:Lark.Lee@tetrattech.com), and the PUCT, [Therese.Harris@puc.texas.gov](mailto:Therese.Harris@puc.texas.gov).

# 1 INTRODUCTION

This volume of the TRM contains the deemed savings for residential measures that have been approved for use in Texas by the Public Utility Commission of Texas (PUCT). This volume includes instructions regarding various savings calculators and reference sources of the information. TRM v8.0 serves as a centralized source of deemed savings values. Where appropriate, Measurement and Verification (M&V) methods by measure category are noted for informational purposes only regarding the basis of projected and claimed savings.

Table 1 provides an overview of the residential measures contained within this Program Year (PY) 2021 TRM 8.0 Volume 2 and the types of deemed savings estimates available for each one. There are five types of deemed savings estimates identified:

- *Point estimates* that provided a single deemed savings value correspond to a single measure or type of technology.
- *Deemed saving tables* that provide energy and peak savings as a function of size, capacity, building type, efficiency level, or other inputs.
- *Savings algorithms* that require specified primary inputs that must be gathered on site and the identification of default inputs where primary data could not be collected. In many cases, these algorithms are provided as references to deemed savings tables, point estimates, or calculator explanations.
- *Calculators* are used by different utilities and implementers to calculate energy savings for different measures. In many cases, there are several different calculators available for a single measure. Sometimes their background calculators are similar, and in other cases, estimates can vary greatly between each calculator.
- *M&V methods* are also used for some measures to calculate savings in the event that standard equipment is not used, or the specified building types do not apply. For some of these measures, both a simplified M&V approach and a full M&V approach may be allowed by the utility. M&V methods as a source of claimed and projected savings are noted for informational purposes only.

Please consult Volume I: Overview and User Guide, Section 5: Structure and Content, for details on the organization of the measure templates presented in this volume.

**Table 1. Residential Deemed Savings by Measure Category**

Measure category	Measure description	Point estimates	Deemed savings tables	Savings algorithm	Calculator	M&V	8.0 update
Lighting	ENERGY STAR® Standard Compact Fluorescent Lamps	–	–	X	–	–	Measure removed
	ENERGY STAR® Specialty Compact Fluorescent Lamps	–	–	X	–	–	Measure removed
	ENERGY STAR® omni-directional LED lamps	–	–	X	–	–	Defined midstream methodology and clarified default wattages by lumen range
	ENERGY STAR® specialty and directional LED lamps	–	–	X	–	–	Defined midstream methodology and clarified default wattages by lumen range. Updated specialty lamps baselines.

Measure category	Measure description	Point estimates	Deemed savings tables	Savings algorithm	Calculator	M&V	8.0 update
HVAC	Air conditioner or heat pump tune-up	-	-	X	-	-	Updated coincidence factors
	Duct sealing	-	-	X	-	X	Updated eligibility and documentation requirements for electric resistance heat
	Ground source heat pumps	-	X	X	-	-	Updated algorithms to make units consistent
	Central air conditioners and heat pumps	-	X	-	-	-	Clarified early retirement age eligibility. Updated electric resistance baseline documentation.
	Mini-split air conditioners and heat pumps	-	X	-	-	-	Clarified early retirement age eligibility. Updated electric resistance baseline documentation.

## 2 RESIDENTIAL MEASURES

---

### 2.1 RESIDENTIAL: LIGHTING

#### 2.1.1 ENERGY STAR® Omni-Directional LED Lamps Measure Overview

**TRM Measure ID:** R-LT-OD

**Market Sector:** Residential

**Measure Category:** Lighting

**Applicable Building Types:** Single-family, multifamily; manufactured

**Fuels Affected:** Electricity

**Decision/Action Type(s):** Retrofit, new construction

**Program Delivery Type(s):** Prescriptive and direct install

**Deemed Savings Type:** Deemed savings calculation

**Savings Methodology:** Engineering algorithms and estimates

#### Measure Description

This measure provides a method for calculating savings for the replacement of an incandescent lamp with an ENERGY STAR®-qualified omni-directional LED lamp <sup>1</sup> in a residential application. Using ANSI C79.1-2002 nomenclature, the applicable omni-directional LED lamp types are A, BT, P, PS, S, and T.<sup>2</sup>

#### Eligibility Criteria

Customer eligibility to be awarded these deemed savings is at the discretion of the utility for different program and customer types. See program-specific manuals to determine customer eligibility.

---

<sup>1</sup> According to ENERGY STAR® omni-directional LED products “ . shall have an even distribution of luminous intensity (candelas) within the 0° to 135° zone (vertically axially symmetrical). Luminous intensity at any angle within this zone shall not differ from the mean luminous intensity for the entire 0° to 135° zone by more than 20 percent. At least 5 percent of total flux (lumens) must be emitted in the 135°-180° zone. Distribution shall be vertically symmetrical as measured in three vertical planes at 0°, 45°, and 90°.”

[http://www.energystar.gov/ia/partners/product\\_specs/program\\_reqs/Integral\\_LED\\_Lamps\\_Program\\_Requirements.pdf](http://www.energystar.gov/ia/partners/product_specs/program_reqs/Integral_LED_Lamps_Program_Requirements.pdf).

<sup>2</sup> ENERGY STAR®-qualified product listing: <https://www.energystar.gov/productfinder/product/certified-light-bulbs/results>.

These savings values rely on usage patterns specific to both indoor and outdoor applications. In lieu of collecting lamp location, a default weighting of 90.5% indoor and 9.5% outdoor may be assumed.<sup>3</sup>

New homes must exceed the lighting equipment requirements of the current state building code (IECC 2015) to be eligible for prescriptive lighting savings.

## Baseline Condition

The baseline is assumed to be the first-tier Energy Independence and Security Act of 2007 (EISA)-mandated maximum wattage for a general service or standard incandescent or halogen lamp (see Table 2). Baseline wattages should be adjusted as EISA regulations dictate higher efficiency standards. A potential second-tier EISA baseline adjustment was scheduled to go into effect beginning January 2020. At that time, general service lamps would need to comply with a 45 lumen-per-watt efficacy standard. However, the Department of Energy (DOE) issued a definition for general service lamps on September 5, 2019, concluding that “no backstop energy conservation has been imposed.”<sup>4</sup> Therefore, no additional baseline adjustment will be imposed starting in 2020. However, standard practice must also be considered in determining an appropriate baseline for this measure. To account for a rapidly changing market, measure life assumptions have been reduced as described later in this measure.

**Table 2. ENERGY STAR® Omni-Directional LEDs—EISA Baselines<sup>5</sup>**

Minimum lumens	Maximum lumens	Incandescent equivalent wattage Pre-EISA 2007	1 <sup>st</sup> tier EISA 2007 ( $W_{Base}$ )
310	749	40	29
750	1,049	60	43
1,050	1,489	75	53
1,490	2,600	100	72

New construction applications use the same baselines; however, savings can only be claimed for efficient lighting installed above the minimum amount required by code. Current code dictates 75% high-efficacy lighting. Therefore, if 100% of installed lighting is high-efficacy, savings can be claimed for the remaining 25% of installed lamps.

<sup>3</sup> 2015 U.S. Lighting Market Characterization, Department of Energy. November 2017. Table 4.11. [https://www.energy.gov/sites/prod/files/2017/12/f46/lmc2015\\_nov17.pdf](https://www.energy.gov/sites/prod/files/2017/12/f46/lmc2015_nov17.pdf).

<sup>4</sup> “Energy Conservation Program: Definition for General Service Lamps”, Department of Energy. 9/5/2019. <https://www.federalregister.gov/documents/2019/09/05/2019-18940/energy-conservation-program-definition-for-general-service-lamps>.

<sup>5</sup> In new ENERGY STAR® lighting standards effective September 2014, lumen bins associated with incandescent wattages have been assigned that do not align with those set out in EISA 2007. Due to the likelihood of continuing sell-through of existing ENERGY STAR® lighting and the on-going use of the EISA bin definitions, this TRM maintains the EISA lumen bins for assigning baseline wattage. Future iterations of the Texas TRM, however, may incorporate these new ENERGY STAR® lumen bins for baseline wattage estimates.

**Table 3. Omni-Directional LEDs—Baseline Wattage<sup>6</sup>**

Minimum lumens	Maximum lumens	Incandescent equivalent wattage	1 <sup>st</sup> tier EISA 2007 ( $W_{Base}$ ) <sup>7</sup>	Default $W_{Post}$ <sup>8</sup> (if unknown)
250	309	25	Exempt	3.5
310	749	40	29	5.5
750	1,049	60	43	9.0
1,050	1,489	75	53	11.5
1,490	2,600	100	72	15.0
2,601	3,300	150	Exempt <sup>9</sup>	22.5

### High-Efficiency Condition

LEDs must be ENERGY STAR<sup>®</sup>-qualified<sup>10</sup> for the relevant lamp shape being installed as outlined in the latest ENERGY STAR<sup>®</sup> specification.<sup>11</sup> Using ANSI C79.1-2002 nomenclature, the applicable omni-directional LED lamp types are A, BT, P, PS, S, and T.

The high-efficiency condition is the wattage of the the replacement lamp.

## Energy and Demand Savings Methodology

### Savings Algorithms and Input Variables

Wattage reduction is defined as the difference between the wattage of a standard baseline lamp, according to EISA 2007 (see Table 3) and the wattage of a comparable omni-directional LED. An LED is considered comparable to the baseline lamp if they are aligned on the lumen output ranges set out in EISA 2007.

For new construction projects, programs should calculate savings using the methodology in this section for all efficient lamps installed in the home. The program should claim savings for the percentage of installed high-efficacy lamps that exceed the minimum required by code, which is currently 75% of lamps. For example, if a new home is built with high-efficacy lamps in 85% of the permanently installed fixtures, the program would claim 10% of the total calculated savings.

<sup>6</sup> Federal standard for General Service Incandescent Lamps (GSILs):

[https://www1.eere.energy.gov/buildings/appliance\\_standards/standards.aspx?productid=20](https://www1.eere.energy.gov/buildings/appliance_standards/standards.aspx?productid=20).

<sup>7</sup> If exempt, refer to incandescent equivalent wattage.

<sup>8</sup> Average rated wattage from ENERGY STAR<sup>®</sup>-qualified product listing rounded to nearest half-watt:

<https://www.energystar.gov/productfinder/product/certified-light-bulbs/results>.

<sup>9</sup> EISA 2007 specified that this lumen range category was subject to a forthcoming efficiency standard than has not yet been finalized.

<sup>10</sup> ENERGY STAR<sup>®</sup>-qualified product listing: <https://www.energystar.gov/productfinder/product/certified-light-bulbs/results>.

<sup>11</sup> <http://www.energystar.gov/products/certified-products/detail/light-bulbs>.

## Energy Savings

Annual energy (kWh) savings are calculated as follows.

$$\Delta kWh = \frac{(W_{base,FT} - W_{post})}{1000} \times Hours \times ISR \times IEF_E$$

Equation 1

Where:

- $W_{(base,FT)}$  = Baseline wattage corresponding with the lumen output of the purchased LED lamp for the year purchased/installed. Reduced baselines are provided for EISA-compliant lamps in Table 2.
- $W_{post}$  = Actual wattage of LED purchased/installed (if unknown, use default wattages from Table 3)
- $HOU$  = Average hours of use per year = 803 hours (for interior/exterior applications calculated based on an average daily usage of 2.2 hours per day<sup>12</sup>)
- $IEF_E$  = Interactive Effects Factor to account for cooling energy savings and heating energy penalties associated with lighting power reductions (see Table 4)
- $ISR$  = In-service Rate, the percentage of incentivized units that are installed and in use (rather than removed, stored, or burnt-out) to account for units incentivized but not operating = 0.97<sup>13</sup>

---

<sup>12</sup> The average daily usage of 2.2 hours per day is a blended value for indoor and outdoor lamps. Source: Evaluation of 2008 Texas 'Make Your Mark' Statewide CFL Program Report. Frontier Energy. June 2009.

<sup>13</sup> Dimetrosky, S., Parkinson, K. and Lieb, N., "Residential Lighting Evaluation Protocol – The Uniform Methods Project. Methods for Determining Energy Efficiency Savings for Specific Measures." January 2015. ISR for upstream programs, including storage lamps installed within four years of purchase. <http://energy.gov/sites/prod/files/2015/02/f19/UMPChapter21-residential-lighting-evaluation-protocol.pdf>.

**Table 4. Omni-Directional LEDs Interactive Effects for Cooling Energy Savings and Heating Energy Penalties<sup>14</sup>**

Heating/cooling type*	IEF <sub>E</sub>				
	Climate zone 1	Climate zone 2	Climate zone 3	Climate zone 4	Climate zone 5
Gas heat with AC	1.06	1.13	1.17	1.15	1.12
Gas heat with no AC	1.00	1.00	1.00	1.00	1.00
Heat pump	0.91	1.00	1.05	1.11	0.97
Electric resistance heat with AC	0.65	0.80	0.90	1.00	0.75
Electric resistance heat with no AC	0.57	0.69	0.76	0.83	0.65
No heat with AC	1.06	1.13	1.17	1.15	1.12
Unconditioned space	1.00	1.00	1.00	1.00	1.00
Heating/cooling unknown <sup>15</sup>	0.88	0.98	1.04	1.07	0.95

\* IEF for homes with no AC is most appropriate for customers with evaporative cooling or room air conditioners.

## Demand Savings

Summer and winter demand savings are determined by applying a coincidence factor associated with each season.

$$\Delta kW_{summer} = \frac{(W_{base,FT} - W_{post})}{1000} \times CF_{summer} \times ISR \times IEF_{D,summer}$$

**Equation 2**

$$\Delta kW_{winter} = \frac{(W_{base,FT} - W_{post})}{1000} \times CF_{winter} \times ISR \times IEF_{D,winter}$$

**Equation 3**

<sup>14</sup> Extracted from BEopt energy models used to estimate savings for envelope measures. Referencing the EISA baseline table, the typical lumen output was determined by taking the midpoint for the 60-watt equivalent lamp (900 lm), which was assumed to be the most typical installation. The resulting lumens were divided by the default wattage for incandescents (43 W), CFLs (13 W), and LEDs (10 W) resulting in an assumed efficacy for incandescents (21 lm/W), CFLs (70 lm/W), and LEDs (90 lm/W). IEF values were calculated using the following formula:  $1 + HVAC_{savings}/Lighting_{savings}$ .

<sup>15</sup> Calculated using IEFs from Cadmus report, weighted using TMY CDD and HDD for Texas, and adjusted to exclude 16 percent outdoor lighting except for upstream defaults. Cadmus report: Cadmus. Entergy Energy-Efficiency Portfolio Evaluation Report 2013 Program Year. Prepared for Entergy Arkansas, Inc. March 14, 2014. Docket No. 07-082-TF.

Where:

$CF$  = Coincidence Factor (see Table 5)

$IEF_D$  = Interactive Effects Factor to account for cooling demand savings or heating demand penalties associated with lighting power reductions (see Table 6)

Heat pump	0.71	0.67	0.65	0.74	0.81
Electric resistance heat with AC	0.44	0.36	0.38	0.42	0.52
Electric resistance heat with no AC	0.44	0.36	0.38	0.42	0.52
No heat with AC	0.98	0.98	0.98	0.98	0.98
Unconditioned space	1.00	1.00	1.00	1.00	1.00
Heating/cooling unknown <sup>19</sup>	0.76	0.72	0.73	0.75	0.80

\* IEF for homes with no AC is most appropriate for customers with evaporative cooling or room air conditioners.

### Upstream/Midstream Program Assumptions

All general service lamps with an equivalent wattage of 100 W or lower distributed through upstream or midstream programs should calculate savings using a combination of residential and non-residential savings methodologies with 85 percent of savings allocated to the residential sector and the remaining 15 percent of savings allocated to the commercial sector.<sup>20</sup>

Table 7. Midstream Assumptions by Lamp Type<sup>21</sup>

Lamp type	HOU	Coincidence factors				
		Zone 1	Zone 2	Zone 3	Zone 4	Zone 5
General Service Lamp ≤ 100W equivalent	1,245	0.15	0.15	0.16	0.16	0.13

### Deemed Energy Savings Tables

There are no lookup tables available for this measure. See engineering algorithms in the previous section for calculating energy and demand savings.

### Deemed Summer Demand Savings Tables

There are no lookup tables available for this measure. See engineering algorithms in the previous section for calculating energy and demand savings.

<sup>19</sup> Ibid.

<sup>20</sup> Weighting assumptions based on review of 2015 U.S. Lighting Market Characterization, Table 4.1. Residential LEDs make up 80-84% of total general purpose and reflector lamp inventory, respectively. [https://www.energy.gov/sites/prod/files/2017/12/f46/lmc2015\\_nov17.pdf](https://www.energy.gov/sites/prod/files/2017/12/f46/lmc2015_nov17.pdf).

<sup>21</sup> Commercial weighting based on 2012 CBECS and 2014 MECS.

## Deemed Winter Demand Savings Tables

There are no lookup tables available for this measure. See engineering algorithms in the previous section for calculating energy and demand savings.

## Claimed Peak Demand Savings

Refer to Volume 1, Section 4 for further details on peak demand savings and methodology.

## Additional Calculators and Tools

Not applicable.

## Measure Life and Lifetime Savings

Historically, the average measure life is based upon the rated lamp life of the LED. The measure life assumes an average use of 2.2 hours per day based on blended usage for indoor/outdoor applications and applies a 0.85 degradation factor to indoor/outdoor LEDs.

$$EUL_{Total} = \frac{Rated\ Life \times DF}{HOU \times 365.25}$$

Equation 4

Where:

<i>Rated Life</i>	=	<i>10,000 hours, 12,000 hours, 15,000 hours, or 20,000 hours, as specified by the manufacturer. If unknown, assume a 10,000-hour lifetime.</i> <sup>22</sup>
<i>DF</i>	=	<i>0.85 degradation factor</i> <sup>23</sup>
<i>HOU</i>	=	<i>2.2 hours per day</i> <sup>24</sup>

However, to account for a rapidly changing market, standard practice dictates that measure life assumptions be reduced to approximate the point at which the residential lighting market has been fully transformed to high-efficiency lamps. Due to market uncertainty in response to a recent rule issued by the Department of Energy, a simplified approach to claim half of the more conservative 16-year EUL will be implemented during the 2020 program year, resulting in an 8-year EUL. This assumption will be reviewed annually to account for current market trends.

---

<sup>22</sup> Minimum lifetime requirement under ENERGY STAR® Lamps Specification V2.1, effective January 2, 2017.  
<https://www.energystar.gov/sites/default/files/ENERGY%20STAR%20Lamps%20V2.1%20Final%20Specification.pdf>.

<sup>23</sup> ENERGY STAR® CFL Third Party Testing and Verification Off-the-Shelf CFL Performance: Batch 3. Figure 27, p. 47.

<sup>24</sup> The average daily usage of 2.2 hours per day is a blended value for indoor and outdoor lamps. Source: Evaluation of 2008 Texas 'Make Your Mark' Statewide CFL Program Report. Frontier Energy. June 2009.

Based on an expected delay in market adoption among certain customer bases, this measure life will be extended to 10 years for programs targeting low-income and hard-to-reach customers.

**Table 8. ENERGY STAR® Omni-Directional LEDs—Estimated Useful Life**

Range of rated measure life (hours)	Assumed rated measure life (hours)	Rated product lifetime (years)	Standard baseline measure life (years)	Low-income baseline measure life (years)
≤ 17,500	15,000	16	8	10
> 17,500	20,000	20*	8	10

\* Measure life capped at 10 years. EUL may be deemed at 8 years in lieu of documenting the customer baseline.

## **Program Tracking Data and Evaluation Requirements**

Primary inputs and contextual data that should be specified and tracked by the program database to inform the evaluation and apply the savings properly are:

- Climate zone
- Number of LEDs installed
- Wattage of each replacement LED
- Lumen output of each replacement LED
- Manufacturer-rated lifetime of each replacement LED in hours
- Heating system type (gas, electric resistance, heat pump)
- Cooling system type (air conditioner, evaporative, none)
- Location of replacement lamp (conditioned, unconditioned, or outdoor); only required when not assuming default weighting
- Proof of purchase – with date of purchase and quantity
- Alternative: representative photos of replacement units or another pre-approved method of installation verification
- ENERGY STAR® certificate matching replacement model number
- Alternative: another pre-approved method of certification (e.g., LM-79, LM-80, TM-21 ISTMT lap reports)
- For new construction projects only, these data points must be gathered for all permanently installed fixtures in the home to document the percentage that are high-efficacy.

## References and Efficiency Standards

### Document Revision History

Table 9. Residential Omni-Directional LED Lamps Revision History

TRM version	Date	Description of change
v3.0	4/10/2015	TRM v3.0 origin.
v3.1	11/05/2015	TRM v3.1 update. Modification of in-service rate, revision of interactive effects factors to reflect indoor-specific values for additional heating and cooling equipment types. Provided default input assumptions for upstream lighting programs. Capped estimated measure life.
v3.1	3/28/2016	TRM v3.1 March revision. Updated summer and winter coincidence factors.
v4.0	10/10/2016	TRM v4.0 update. Updated IEF values and useful life estimates.
v5.0	10/2017	TRM v5.0 update. Updated EUL algorithm to account for baseline change beginning in 2021. Included language to deem EUL.
v6.0	11/2018	TRM v6.0 update. Updated useful life estimates. Updated interactive effects factors.
v7.0	10/2019	TRM v7.0 update. Removed dual baseline and updated useful life estimates. Added invoice and certificate requirements. Added option for new construction savings.
v8.0	10/2020	TRM v8.0 update. Defined midstream methodology and clarified default wattages by lumen range.

## 2.1.2 ENERGY STAR® Specialty and Directional LED Lamps Measure Overview

**TRM Measure ID:** R-LT-SD

**Market Sector:** Residential

**Measure Category:** Lighting

**Applicable Building Types:** Single-family, multifamily, manufactured

**Fuels Affected:** Electricity

**Decision/Action Type(s):** Retrofit, new construction

**Program Delivery Type(s):** Prescriptive and direct install

**Deemed Savings Type:** Deemed savings calculation

**Savings Methodology:** Engineering algorithms and estimates

### Measure Description

This measure provides a method for calculating savings for replacement of an incandescent or halogen reflector or decorative lamp with an ENERGY STAR®-qualified LED lamp in a residential application. These lamps include reflectors, G-shape lamps, T-shape lamps, B, BA, CA, F G16-1/2, G25, G30, S, or M14 lamps.<sup>25</sup>

### Eligibility Criteria

Customer eligibility to be awarded these deemed savings is at the discretion of the utility for different program and customer types. See program-specific manuals to determine customer eligibility.

These savings values rely on usage patterns specific to both indoor and outdoor applications. In lieu of collecting lamp location, a default weighting of 90.5% indoor and 9.5% outdoor may be assumed.<sup>26</sup>

New homes must exceed the lighting equipment requirements of the current state building code (IECC 2015) to be eligible for prescriptive lighting savings.

### Baseline Condition

The baseline wattage will be determined based on the bulb shape of the installed lamp, as outlined below. New construction applications use the same baselines; however, savings can only be claimed for efficient lighting installed above the minimum amount required by code.

---

<sup>25</sup> <http://www.energystar.gov/products/certified-products/detail/light-bulbs>.

<sup>26</sup> 2015 U.S. Lighting Market Characterization, Department of Energy. November 2017. Table 4.11. [https://www.energy.gov/sites/prod/files/2017/12/f46/lmc2015\\_nov17.pdf](https://www.energy.gov/sites/prod/files/2017/12/f46/lmc2015_nov17.pdf).

Current code dictates 75% high-efficacy lighting. Therefore, if 100% of installed lighting is high-efficacy, savings can be claimed for the remaining 25% of installed lamps.

Some baseline conditions for specialty LEDs are affected by EISA and/or a DOE 2009 ruling on incandescent reflector lamps (IRLs). Based on the shape, lumen output, and/or wattage-equivalent of the installed lamp, the appropriate baseline shall be determined from one of the following categories. Appropriate baseline wattages are presented in Table 10 through Table 12. If a baseline cannot be determined using these tables, the following guidelines may be used to determine appropriate default baseline wattage:

- Non-reflector lamps, affected by EISA 2007: using the rated lumen output of the installed LED, determine the appropriate first-tier EISA baseline default wattage from Table 10
- Non-reflector lamps, not affected by EISA 2007: ENERGY STAR® rated equivalent wattage of installed LED
- Reflector lamps affected by the DOE ruling in 2009 on IRLs: using the rated lumen output of the installed LED, determine the appropriate first-tier EISA baseline default wattage from Table 12
- Reflector lamps not affected by the DOE ruling in 2009 on IRLs: ENERGY STAR® rated equivalent wattage of installed LED

### ***EISA Standards: Baseline for Non-Reflector Lamps***

#### **EISA-Affected**<sup>27</sup>

EISA-affected bulbs are:

- G-shape lamps with a diameter less than 5 inches
- T-shape lamps greater than 40 watts or with a length of 10 inches or less
- B, BA, CA, F G16-1/2, G25, G30, S, or M14 lamps greater than 40 watts

**Table 10. Specialty/Directional LEDs—General Service Non-Reflector Baseline Wattage**<sup>28</sup>

Minimum lumens	Maximum lumens	Incandescent equivalent wattage	1 <sup>st</sup> tier EISA 2007 ( $W_{Base}$ ) <sup>29</sup>	Default $W_{Post}$ <sup>30</sup> (if unknown)
250	309	25	Exempt	3.5
310	749	40	29	5.5
750	1,049	60	43	9.0
1,050	1,489	75	53	11.5

<sup>27</sup> Energy Independence and Security Act of 2007, Subtitle B – Lighting Energy Efficiency, Section 321 Efficient Light Bulbs. <https://www.govinfo.gov/content/pkg/BILLS-110hr6enr/pdf/BILLS-110hr6enr.pdf>.

<sup>28</sup> Federal standard for General Service Incandescent Lamps (GSILs): [https://www1.eere.energy.gov/buildings/appliance\\_standards/standards.aspx?productid=20](https://www1.eere.energy.gov/buildings/appliance_standards/standards.aspx?productid=20).

<sup>29</sup> If exempt, refer to incandescent equivalent wattage.

<sup>30</sup> Average rated wattage from ENERGY STAR®-qualified product listing rounded to nearest half-watt: <https://www.energystar.gov/productfinder/product/certified-light-bulbs/results>.

Minimum lumens	Maximum lumens	Incandescent equivalent wattage	1 <sup>st</sup> tier EISA 2007 ( $W_{Base}$ ) <sup>29</sup>	Default $W_{Post}$ <sup>30</sup> (if unknown)
1,490	2,600	100	72	15.0
2,601	3,300	150	Exempt <sup>31</sup>	22.5

### EISA-Exempt<sup>32</sup>

EISA-exempt bulbs are:

- Appliance lamps, black light lamps, bug lamps, colored lamps, infrared lamps, left-hand thread lamps, marine lamps, marine signal service lamps, mine service lamps, plant light lamps, reflector lamps, rough service lamps, shatter-resistant lamps, sign service lamps, silver bowl lamps, showcase lamps, 3-way incandescent lamps, and vibration service lamps
- G-shape lamp with a diameter of 5 inches or more
- T-shape lamp of 40 watts or less or a length of more than 10 inches
- B, BA, CA, F, G16-1/2, G25, G30, S, or M14 lamp of 40 watts or less<sup>33</sup>

<sup>31</sup> EISA 2007 specified that this lumen range category was subject to a forthcoming efficiency standard that has not yet been finalized.

<sup>32</sup> Energy Independence and Security act of 2007 (EISA 2007), <https://www.govinfo.gov/content/pkg/PLAW-110publ140/pdf/PLAW-110publ140.pdf>.

<sup>33</sup> <https://www.lightingfacts.com/Library/Content/FAQs/EISA>

**Table 11. Specialty/Directional LEDs—Decorative Non-Reflector Baseline Wattage<sup>34</sup>**

Lamp Type	Minimum Lumens	Maximum Lumens	W <sub>Base</sub>	Default W <sub>Post</sub> <sup>35</sup> (if unknown)
3-Way	250	349	25	3.0
	350	499	40	5.0
	500	849	60 <sup>36</sup>	8.0
	850	1,199	75 <sup>37</sup>	10.5
	1,200	1,999	100	14.5
	2,000	--	150	22.0
G-shape with diameter ≥ 5 inches <sup>38</sup>	--	--	--	--
Decorative (B, BA, CA, F, S, T)	120	159	15 <sup>39</sup>	1.5
	160	299	25	2.5
	300	499	40	4.5
	500	--	60	5.5

## **DOE Standards for Incandescent Reflector Lamps (IRLs): Baseline for Reflector Lamps**

### **DOE-Ruling-Affected<sup>40</sup>**

Certain types of incandescent reflector bulbs are affected by a DOE 2009 ruling on reflector lamps. Products affected by the IRL ruling are:

- R, PAR, ER, BR, BPAR lamps
- BR and ER lamps rated at more than 50 watts
- Reflector lamps between 2.25" (R18) and 2.75" (R22) in diameter
- 40-205 Watt incandescent PAR lamps

<sup>34</sup> Federal standard for Incandescent Reflector Lamps (IRLs):

[https://www1.eere.energy.gov/buildings/appliance\\_standards/standards.aspx?productid=23](https://www1.eere.energy.gov/buildings/appliance_standards/standards.aspx?productid=23).

<sup>35</sup> Average rated wattage from ENERGY STAR®-qualified product listing rounded to nearest half-watt:

<https://www.energystar.gov/productfinder/product/certified-light-bulbs/results>.

<sup>36</sup> No products for this equivalent wattage are available on the ENERGY STAR®-qualified product listing. Lumen range for this row is split evenly and default wattage is interpolated between the available categories.

<sup>37</sup> Ibid.

<sup>38</sup> G-shape lamps are not included because there were very few ENERGY STAR®-qualified products with a diameter of 5 inches or more. For these products, use the equivalent and rated wattages from the ENERGY STAR® certification.

<sup>39</sup> The 15-watt equivalent category only applies to lamps with a candelabra base.

<sup>40</sup> Federal standard for Incandescent Reflector Lamps (IRLs):

[https://www1.eere.energy.gov/buildings/appliance\\_standards/standards.aspx?productid=23](https://www1.eere.energy.gov/buildings/appliance_standards/standards.aspx?productid=23).

The baseline wattage can be determined according to the lumen range of the installed lamp (see Table 12)

**DOE-Ruling-Exempt<sup>41</sup>**

The DOE 2009 ruling standards do not apply to the following types of IRLs:

- IRLs rated at 50 watts or less that are ER30, BR30, BR40, or ER40 lamps
- IRLs rated at 65 watts that are BR30, BR40, or ER40 lamps
- R20 IRLs rated 45 watts or less.

**Table 12. Specialty/Directional LEDs—Reflector Baseline Wattage<sup>42</sup>**

Lamp type <sup>43</sup>	Minimum lumens	Maximum lumens	W <sub>Base</sub>	Default W <sub>Post</sub> <sup>44</sup> (if unknown)

	900	1,399	75	12.5
	1,400	--	100	14.0

## High- Efficiency Condition

LEDs must be ENERGY STAR®-qualified<sup>45</sup> for the relevant lamp shape being removed as outlined in the latest ENERGY STAR® specification.<sup>46</sup> These lamps include reflectors, G-shape lamps, T-shape lamps, B, BA, CA, F G16-1/2, G25, G30, S, or M14 lamps.

The high-efficiency condition is the wattage of the replacement lamp.

## Energy and Demand Savings Methodology

### Savings Algorithms and Input Variables

Wattage reduction is defined as the difference between the wattage of a specialty baseline lamp and the wattage of a directional or specialty LED.

For new construction projects, programs should calculate savings using the methodology in this section for all efficient lamps installed in the home. The program should claim savings for the percentage of installed high-efficacy lamps that exceed the minimum required by code, which is currently 75% of lamps. For example, if a new home is built with high-efficacy lamps in 85% of the permanently installed fixtures, the program would claim 10% of the total calculated savings.

### *Energy Savings Algorithms*

For EISA-affected lamps only, annual energy (kWh) savings are calculated as follows,

$$\Delta kWh = \frac{(W_{base,FT} - W_{post})}{1000} \times HOU \times ISR \times IEF_E$$

Equation 5

For EISA-exempt lamps and reflectors (both DOE-ruling-exempt and DOE-ruling-affected), annual energy (kWh) savings are calculated as follows.

$$\Delta kWh = \frac{(W_{base} - W_{post})}{1000} \times HOU \times ISR \times IEF_E$$

Equation 6

Where:

$W_{base,FT}$  = First-tier EISA baseline wattage corresponding with the lumen output of the purchased LED lamp for the year purchased/installed. First-tier EISA baseline lamp wattage provided in Table 10 under the column "1st Tier EISA 2007 ( $W_{Base}$ )."

<sup>45</sup> ENERGY STAR®-qualified product listing: <https://www.energystar.gov/productfinder/product/certified-light-bulbs/results>

<sup>46</sup> ENERGY STAR® specification: <http://www.energystar.gov/products/certified-products/detail/light-bulbs>

$W_{base}$  = EISA-exempt specialty lamp or a DOE-ruling-exempt reflector, use the appropriate baseline wattage from Table 11 and Table 12. (If a DOE-ruling-affected IRL, use the wattages provided in Table 12)

\* IEF for homes with no AC is most appropriate for customers with evaporative cooling or room air conditioners.

### **Demand Savings Algorithms**

Summer and winter demand savings are determined by applying a coincidence factor associated with each season.

$$\Delta kW_{summer} = \frac{(W_{base,FT} - W_{post})}{1000} \times CF_{summer} \times ISR \times IEF_{D,summer}$$

**Equation 7**

$$\Delta kW_{winter} = \frac{(W_{base,FT} - W_{post})}{1000} \times CF_{winter} \times ISR \times IEF_{D,winter}$$

**Equation 8**

<sup>49</sup> Extracted from BEopt energy models used to estimate savings for envelope measures. Referencing the EISA baseline table, the typical lumen output was determined by taking the midpoint for the 60 watt equivalent lamp (900 lm), which was assumed to be the most typical installation. The resulting lumens were divided by the default wattage for incandescents (43 W), CFLs (13 W), and LEDs (10 W) resulting in an assumed efficacy for incandescents (21 lm/W), CFLs (70 lm/W), and LEDs (90 lm/W). IEF values were calculated using the following formula:  $1 + HVAC_{savings}/Lighting_{savings}$ .

<sup>50</sup> Calculated using IEFs from Cadmus report, weighted using TMY CDD and HDD for Texas, and adjusted to exclude 16 percent outdoor lighting except for upstream defaults. Cadmus report: Cadmus. Entergy Energy-Efficiency Portfolio Evaluation Report 2013 Program Year. Prepared for Entergy Arkansas, Inc. March 14, 2014. Docket No. 07-082-TF.

For EISA-exempt lamps and reflectors (both DOE-ruling-exempt and DOE-ruling-affected), peak demand (kW) savings are not calculated using the two-tiered system. Instead, peak demand (kW) savings are calculated using one algorithm, depending on the season of the savings.

$$\Delta kW_{summer} = \frac{(W_{base} - W_{post})}{1000} \times CF_{summer} \times ISR \times IEF_{D,summer}$$

**Equation 9**

$$\Delta kW_{winter} = \frac{(W_{base} - W_{post})}{1000} \times CF_{winter} \times ISR \times IEF_{D,winter}$$

**Equation 10**

Where:

*CF* = Coincidence Factor (Table 14)

*IEF<sub>D</sub>* = Interactive Effects Factor to account for cooling demand savings or heating demand penalties associated with lighting power reductions (see Table 15)

\* IEF for homes with no AC is most appropriate for customers with evaporative cooling or room air conditioners.

### Upstream/Midstream Program Assumptions

All general service, decorative, and reflector lamps with an equivalent wattage of 100 W or lower distributed through upstream or midstream programs should calculate savings using a combination of residential and non-residential savings methodologies with 85 percent of savings allocated to the residential sector and the remaining 15 percent of savings allocated to the commercial sector.<sup>55</sup>

**Table 16. Specialty/Directional LEDs—Midstream Assumptions by Lamp Type<sup>56</sup>**

Lamp type	HOU	Coincidence factors				
		Zone 1	Zone 2	Zone 3	Zone 4	Zone 5
General Service Lamp < 100W equivalent	1,245	0.15	0.15	0.16	0.16	0.13
Directional/Reflector < 100W equivalent	1,249	0.17	0.16	0.17	0.17	0.15

### Deemed Energy Savings Tables

There are no lookup tables available for this measure. See engineering algorithms in the previous section for calculating energy and demand savings.

<sup>54</sup> Calculated using IEFs from Cadmus report, weighted using TMY CDD and HDD for Texas, and adjusted to exclude 16 percent outdoor lighting except for upstream defaults. Cadmus report: Cadmus. Entergy Energy-Efficiency Portfolio Evaluation Report 2013 Program Year. Prepared for Entergy Arkansas, Inc. March 14, 2014. Docket No. 07-082-TF.

<sup>55</sup> Weighting assumptions based on review of 2015 U.S. Lighting Market Characterization, Table 4.1. Residential LEDs make up 80-84% of total general purpose and reflector lamp inventory, respectively. [https://www.energy.gov/sites/prod/files/2017/12/f46/lmc2015\\_nov17.pdf](https://www.energy.gov/sites/prod/files/2017/12/f46/lmc2015_nov17.pdf).

<sup>56</sup> Commercial weighting based on 2012 CBECS and 2014 MECS.

## Deemed Summer Demand Savings Tables

There are no lookup tables available for this measure. See engineering algorithms in the previous section for calculating energy and demand savings.

## Deemed Winter Demand Savings Tables

There are no lookup tables available for this measure. See engineering algorithms in the previous section for calculating energy and demand savings.

## Claimed Peak Demand Savings

Refer to Volume 1, Section 4 for further details on peak demand savings and methodology.

## Additional Calculators and Tools

Not applicable.

## Measure Life and Lifetime Savings

Historically, the average measure life is based upon rated lamp life of the LED. The measure life assumes an average use of 2.2 hours per day based on blended usage for indoor/outdoor applications and applies a 0.85 degradation factor to indoor/outdoor LEDs.

$$EUL_{Total} = \frac{Rated\ Life \times DF}{HOU \times 365.25}$$

Equation 11

Where:

<i>Rated Life</i>	=	10,000 hours, 12,000 hours, 15,000 hours, or 20,000 hours, as specified by the manufacturer. If unknown, assume a 10,000-hour lifetime. <sup>57</sup>
<i>DF</i>	=	0.85 degradation factor <sup>58</sup>
<i>HOU</i>	=	2.2 hours per day <sup>59</sup>

<sup>57</sup> Minimum lifetime requirement under ENERGY STAR® Lamps Specification V2.1, effective January 2, 2017.

<https://www.energystar.gov/sites/default/files/ENERGY%20STAR%20Lamps%20V2.1%20Final%20Specification.pdf>.

<sup>58</sup> ENERGY STAR® CFL Third Party Testing and Verification Off-the-Shelf CFL Performance: Batch 3. Figure 27, p. 47.

<sup>59</sup> The average daily usage of 2.2 hours per day is a blended value for indoor and outdoor lamps. Source: Evaluation of 2008 Texas 'Make Your Mark' Statewide CFL Program Report. Frontier Energy (formerly Associates). June 2009.

## EISA Compliant Lamps

To account for a rapidly changing market, standard practice dictates that measure life assumptions be reduced to approximate the point at which the residential lighting market has been fully transformed to high-efficiency lamps. Due to market uncertainty in response to a recent rule issued by the Department of Energy, a simplified approach to claim half of the more conservative 16-year EUL will be implemented during the 2020 program year, resulting in an 8-year EUL. This assumption will be reviewed annually to account for current market trends.

Based on an expected delay in market adoption among certain customer bases, this measure life will be extended to 10 years for programs targeting low-income and hard-to-reach customers.

These reductions do not apply to specialty lamps.

**Table 17. Specialty/Directional LEDs—Estimated Useful Life**

Range of Rated Measure Life (Hours)	Assumed Rated Measure Life (Hours)	Specialty Measure Life (Years)	If EISA Compliant:	
			Standard Baseline Measure Life (Years)	Low-income Baseline Measure Life (Years)
≤ 17,500	15,000	16	8	10
> 17,500	20,000	20*	8	10

\* Measure life capped at 20 or 10 years depending on the applicable baseline. EUL may be deemed at 16 or 8 years in lieu of collecting manufacturer rated life or documenting customer baseline for EISA compliant lamps.

## Program Tracking Data and Evaluation Requirements

Primary inputs and contextual data that should be specified and tracked by the program database to inform the evaluation and apply the savings properly are:

- Climate zone
- Number of LEDs installed
- ANSI C79.1-2002 nomenclature of LED installed (G40, PAR, etc.)
- Baseline and rated wattages of each replacement LED
- Lumen output of each replacement LED
- Wattage of replaced lamp
- Manufacturer-rated lifetime of each replacement LED in hours
- Heating system type (gas, electric resistance, heat pump)
- Cooling system type (air conditioner, evaporative cooler, none)
- Location of installed lamp (conditioned, unconditioned, or outdoor); only required when not assuming default weighting

- Baseline calculation methodology (EISA-affected non-reflector, EISA-exempt non-reflector, DOE-ruling-affected reflector, DOE-ruling-exempt reflector, manufacturer-rated equivalent incandescent wattage, or default wattage)
- Proof of purchase – with date of purchase and quantity
  - Alternative: representative photos of installed units or other pre-approved method of installation verification
- ENERGY STAR® certificate matching replacement model number
  - Alternative: other pre-approved method of certification (e.g., LM-79, LM-80, TM-21 ISTMT lap reports)
- For new construction projects only, these data points must be gathered for all permanently installed fixtures in the home to document the percentage that are high-efficacy.

## **References and Efficiency Standards**

**Table 18. Residential Specialty and Directional LED Lamps Revision History**

<b>TRM version</b>	<b>Date</b>	<b>Description of change</b>
v3.0	4/10/2015	TRM v3.0 origin.
v3.1	11/05/2015	TRM v3.1 update. Modification of in-service rate, revision of interactive effects factors to reflect indoor-specific values for additional heating and cooling equipment types. Consolidated default input assumptions for upstream lighting programs. Capped estimated measure life.
v3.1	3/28/2016	TRM v3.1 March revision. Updated summer and winter coincidence factors.
v4.0	10/10/2016	TRM v4.0 update. Updated IEF values.
v5.0	10/2017	TRM v5.0 update. Updated useful life estimates.
v6.0	11/2018	TRM v6.0 update. Updated useful life estimates. Updated interactive effects factors.

TRM version	Date	Description of change
v7.0	10/2019	TRM v7.0 update. Removed dual baseline and updated useful life estimates. Added invoice and certificate requirements. Added option for new construction savings.
v8.0	10/2020	TRM v8.0 update. Defined midstream methodology and clarified default wattages by lumen range. Updated specialty lamps baselines.

## 2.2 RESIDENTIAL: HEATING, VENTILATION, AND AIR CONDITIONING

### 2.2.1 Air Conditioner or Heat Pump Tune-Ups Measure Overview

**TRM Measure ID:** R-HV-TU

**Market Sector:** Residential

**Measure Category:** HVAC

**Applicable Building Types:** Single-family, multifamily, manufactured

**Fuels Affected:** Electricity

**Decision/Action Type(s):** Retrofit

**Program Delivery Type(s):** Prescriptive

**Deemed Savings Type:** Deemed savings calculation

**Savings Methodology:** Engineering algorithms and estimates

### Measure Description

This measure applies to central air conditioners (AC) and heat pumps (HP) of any configuration where all applicable actions from the checklist below are completed. An AC tune-up involves checking, cleaning, adjusting, and resetting the equipment to factory conditions to restore operating efficiencies, on average, closer to as-new performance. This measure applies to all residential applications.

For this measure, the service technician must complete the following tasks according to industry best practices. To properly assess and adjust the refrigerant charge level, the unit must be operating under significant (normal) cooling load conditions. Therefore, this measure may only be performed for energy savings reporting purposes when the outdoor ambient dry bulb temperature is above 75°F, and the indoor return air dry bulb temperature is above 70°F.

Air conditioner inspection and tune-up checklist:<sup>60</sup>

- Tighten all electrical connections; measure motor voltage and current
- Lubricate all moving parts, including motor and fan bearings
- Inspect and clean the condensate drain
- Inspect controls of the system to ensure proper and safe operation. Check the startup/shutdown cycle of the equipment to assure the system starts, operates, and shuts off properly.
- Clean evaporator and condenser coils

---

<sup>60</sup> Based on ENERGY STAR® HVAC Maintenance Checklist.  
[www.energystar.gov/index.cfm?c=heat\\_cool.pr\\_maintenance](http://www.energystar.gov/index.cfm?c=heat_cool.pr_maintenance).

- Clean indoor blower fan components
- Inspect and clean or change air filters; replacement preferred best practice
- Measure airflow via static pressure across the cooling coil and adjust to manufacturers specifications
- Check refrigerant level and adjust to manufacturer specifications
- Check capacitor functionality and capacitance; compare to OEM specifications

## Eligibility Criteria

All residential customers are eligible for this measure if they have refrigerated air conditioning 65,000 Btu/hr or less in cooling capacity that has not been serviced in the last 5 years.

## Baseline Condition

The baseline is a system with some or all of the following issues:

- Dirty condenser coil
- Dirty evaporator coil
- Dirty blower wheel
- Dirty filter
- Improper airflow
- Incorrect refrigerant charge

The baseline system efficiency should be calculated using the following formulas:

$$EER_{pre} = (1 - EL) \times EER_{post}$$

**Equation 12**

$$HSPF_{pre} = (1 - EL) \times HSPF_{post}$$

**Equation 13**

Where:

$EER_{pre}$	=	Efficiency of the cooling equipment before tune-up
$EL$	=	Efficiency loss due to dirty coils, blower, filter, improper airflow, and/or incorrect refrigerant charge = 0.05
$EER_{post}$	=	Deemed cooling efficiency of the equipment after tune-up = 11.2 EER
$HSPF_{pre}$	=	Heating efficiency of the air source heat pump before tune-up
$HSPF_{post}$	=	Deemed heating efficiency of air source heat pumps after tune-up = 7.7 HSPF

## High-Efficiency Condition

After the tune-up, the equipment must be clean with airflows and refrigerant charges adjusted as appropriate and set forth above, with the added specification that refrigerant charge adjustments must be within +/- 3 degrees of target sub-cooling for units with thermal expansion valves (TXV) and +/- 5 degrees of target super heat for units with fixed orifices or capillary tubes.

The efficiency standard, or efficiency after the tune-up, is deemed to be the manufacturer specified energy efficiency ratio (EER) of the existing central air conditioner or heat pump, which has been determined using the following logic and standards. The useful life of an AC unit is 19 years. The useful life of a heat pump is 16 years. Therefore, it is conservatively thought that the majority of existing, functioning units were installed under the federal standard in place between January 23, 2006 and January 1, 2015, which set a baseline of 13 SEER and 7.7 HSPF<sup>61</sup>. A 13 SEER is equivalent to approximately 11.2 EER<sup>62</sup> using the conversion developed by Lawrence Berkeley Lab and US DOE:  $EER = -0.02 \times SEER^2 + 1.12 \times SEER$ .

## Energy and Demand Savings Methodology

### Savings Algorithms and Input Variables

Savings are based on an assumed efficiency loss factor of 5 percent due to dirty coils, dirty filters, improper airflow, and/or incorrect refrigerant charge.<sup>63</sup>

### Energy Savings Algorithms

Heating energy savings are only applicable to heat pumps.

$$Energy\ Savings\ [kWh_{savings}] = kWh_{savings,C} + kWh_{savings,H}$$

Equation 14

$$Energy\ (Cooling)\ [kWh_{savings,C}] = Capacity_C \times \left( \frac{1}{EER_{pre}} - \frac{1}{EER_{post}} \right) \times EFLH_C \times \frac{1\ kW}{1,000\ W}$$

Equation 15

$$Energy\ (Heating)\ [kWh_{savings,H}] = Capacity_H \times \left( \frac{1}{HSPF_{pre}} - \frac{1}{HSPF_{post}} \right) \times EFLH_H \times \frac{1\ kW}{1,000\ W}$$

Equation 16

Where:

<sup>61</sup> Code specified HSPF from federal standard effective January 23, 2006 through January 1, 2015.

<sup>62</sup> Code specified 13 SEER from federal standard effective January 23, 2006 through January 1, 2015, converted to EER using  $EER = -0.02 \times SEER^2 + 1.12 \times SEER$ . National Renewable Energy Laboratory (NREL). "Building America House Simulation Protocols." U.S. Department of Energy. Revised October 2010. <http://www.nrel.gov/docs/fy11osti/49246.pdf>.

<sup>63</sup> Energy Center of Wisconsin, May 2008; "Central Air Conditioning in Wisconsin, A Compilation of Recent Field Research."

- $Capacity_C$  = Rated cooling capacity of the equipment based on model number [Btuh] (1 ton = 12,000 Btuh)
- $Capacity_H$  = Rated heating capacity of the equipment based on model number [Btuh] (1 ton = 12,000 Btuh)
- $EER_{pre}$  = Cooling efficiency of the equipment pre-tune-up using Equation 12 [Btuh/W]
- $EER_{post}$  = Cooling efficiency of the equipment after the tune-up [Btuh/W]. Assume 11.2.
- $HSPF_{pre}$  = Heating efficiency of the equipment pre-tune-up using Equation 13 [Btuh/W]
- $HSPF_{post}$  = Heating efficiency of the equipment after the tune-up [Btuh/W]. Assume 7.7.
- $EFLH_{C/H}$  = Cooling/heating equivalent full-load hours for appropriate climate zone [hours]

**Table 19. AC/HP Tune-Ups—Equivalent Full Load Cooling/Heating Hours<sup>64</sup>**

Climate zone	EFLH <sub>C</sub>	EFLH <sub>H</sub>
Climate zone 1: Panhandle	1,142	1,880
Climate zone 2: North	1,926	1,343
Climate zone 3: South	2,209	1,127
Climate zone 4: Valley	2,958	776
Climate zone 5: West	1,524	1,559

### Demand Savings Algorithms

$$\text{Summer Peak Demand } [kW_{Savings,C}] = \text{Capacity} \times \left( \frac{1}{EER_{pre}} - \frac{1}{EER_{post}} \right) \times DF_C \times \frac{1 \text{ kW}}{1,000 \text{ W}}$$

**Equation 17**

$$\text{Winter Peak Demand } [kW_{Savings,H}] = \text{Capacity} \times \left( \frac{1}{HSPF_{pre}} - \frac{1}{HSPF_{post}} \right) \times DF_H \times \frac{1 \text{ kW}}{1,000 \text{ W}}$$

**Equation 18**

Summer and winter demand savings are determined by applying a coincidence factor for each season. Winter peak demand savings are only applicable to heat pumps.

Where:

<sup>64</sup> ENERGY STAR® Central AC/HP Savings Calculator. April 2009 update.  
[https://www.energystar.gov/sites/default/files/asset/document/ASHP\\_Sav\\_Calc.xls](https://www.energystar.gov/sites/default/files/asset/document/ASHP_Sav_Calc.xls).

$DF_C$  = Cooling coincidence factor (see Table Table 20)

$DF_H$  = Heating coincidence factor (see Table Table 20)

**Table 20. AC/HP Tune-Ups—Coincidence Factors by Climate Zone<sup>65</sup>**

Season	Climate zone 1: Amarillo	Climate zone 2: Dallas	Climate zone 3: Houston	Climate zone 4: Corpus Christi	Climate zone 5: El Paso
Summer	0.644	0.707	0.633	0.577	0.784
Winter	0.399	0.310	0.341	0.293	0.444

## Deemed Energy Savings Tables

Applying the above algorithms results in the deemed energy savings per ton in Table 21. Heating savings are only applicable for heat pumps.

**Table 21. AC/HP Tune-Ups—Deemed Energy Savings per Ton**

Climate zone	Cooling kWh saved per ton	Heating kWh saved per ton
Climate zone 1: Panhandle	64.4	154.2
Climate zone 2: North	108.6	110.2
Climate zone 3: South	124.6	92.4
Climate zone 4: Valley	166.8	63.7
Climate zone 5: West	85.9	127.9

## Deemed Summer Demand Savings Tables

Applying the above algorithms results in the deemed summer demand savings per ton in Table 22.

**Table 22. AC/HP Tune-Ups—Deemed Summer Demand Savings per Ton**

Climate zone	Summer peak demand kW savings per Ton
Climate zone 1: Panhandle	0.036
Climate zone 2: North	0.040
Climate zone 3: South	0.036
Climate zone 4: Valley	0.033
Climate zone 5: West	0.044

<sup>65</sup> See Volume 1, Section 4.

## Deemed Winter Demand Savings Tables

Applying the above algorithms results in the deemed winter demand savings per ton in Table 23. Winter peak demand savings are only applicable for heat pumps.

Table 23. AC/HP Tune-Ups—Deemed Winter Demand Savings per Ton

Climate zone	Winter peak demand kW savings per ton
Climate zone 1: Panhandle	0.033
Climate zone 2: North	0.025
Climate zone 3: South	0.028
Climate zone 4: Valley	0.024
Climate zone 5: West	0.036

## Claimed Peak Demand Savings

Refer to Volume 1, Section 4 for further details on peak demand savings and methodology.

## Additional Calculators and Tools

Not applicable.

## Measure Life and Lifetime Savings

The estimated useful life (EUL) for a tune-up is five years.<sup>66</sup>

According to the 2014 California Database for Energy Efficiency Resources (DEER), the estimated useful life of cleaning condenser and evaporator coils is three years<sup>67</sup>, and the estimated useful life of refrigerant charge adjustment is ten years.<sup>68</sup> The other parts of the tune-up checklist are not listed in DEER. Therefore five years is used as the best representation of the entire tune-up.

## Program Tracking Data and Evaluation Requirements

Primary inputs and contextual data that should be specified and tracked by the program database to inform the evaluation and apply the savings properly are:

- Climate zone or county
- Manufacturer
- Model Number

<sup>66</sup> GDS Associates, Inc. (2007). Measure Life Report: Residential and Commercial/Industrial Lighting and HVAC Measures. Prepared for The New England State Program Working Group; Page 1-3, Table 1. ## 2.2.2 Duct Sealing Measure Overview

**TRM Measure ID:** R-HV-DS

**Market Sector:** Residential

**Measure Category:** HVAC

**Applicable Building Types:** Single-family, manufactured

**Fuels Affected:** Electricity and gas

**Decision/Action Type(s):** Retrofit

**Program Delivery Type(s):** Prescriptive

**Deemed Savings Type:** Look-up tables

**Savings Methodology:** Building simulation modeling

### Measure Description

This measure involves sealing leaks in supply and return ducts of the HVAC distribution systems in homes or converted residences with central air conditioning. The standard approach to estimate savings in this measure is based on the results obtained via pre- and post-leakage testing as defined in this measure. In lieu of leakage testing, savings for eligible duct sealing projects may be claimed using the alternate approach specified in this measure.

### Eligibility Criteria

All single-family customers with ducted central refrigerated air conditioning or evaporative cooling are eligible to claim cooling savings for this measure. Customers must have ducted central heating with either a furnace (gas or electric resistance) or a heat pump to claim heating savings. The specified deemed savings are not applicable to multifamily customers or to residences with space (non-central or ducted) air conditioning or heating.

For the standard approach with leakage testing, duct leakage should be assessed following the Building Performance Institute (BPI) standards. Duct leakage testing should not be conducted in homes where either evidence of asbestos or mold is present or suspected due to the age of the home.<sup>69</sup>

---

<sup>69</sup> "Technical Standards for the Building Analyst Professional", Building Performance Institute (BPI), v1/4/12, Page 1 of 17, states:  
"Health and Safety: Where the presence of asbestos, lead, mold and/or other potentially hazardous material is known or suspected, all relevant state and federal (EPA) guidelines must be followed to ensure technician and occupant safety. Blower door depressurization tests may not be performed in homes *where there is a risk of asbestos becoming airborne and being drawn into the dwelling.*"  
<http://www.bpi.org/sites/default/files/Technical%20Standards%20for%20the%20Building%20Analyst%20Professional.pdf>.

Utility program manuals should be consulted for health and safety considerations related to the implementation of duct efficiency measures and/or testing procedures.

Duct sealing is a residential retrofit measure only and does not apply to new construction.

## Baseline Condition

The savings calculation methods for this measure (when implemented with duct leakage testing) are valid up to a maximum pre-installation leakage rate of 35 percent of total fan flow.<sup>70</sup> For homes with an initial leakage rate greater than 35 percent of total fan flow, savings will be awarded with respect to this cap rather than the initial leakage. Data from nearly 28,000 single-family and mobile home duct blaster tests conducted for duct efficiency improvements in Texas between 2003 and 2006 show that more than 70 percent of all pre-retrofit leakage rates fall below 38 percent total leakage.<sup>71</sup>

Engineering calculations show that the interior temperature in those settings that exceed 38 percent total leakage would be above the thermally acceptable comfort levels published by ASHRAE in its 2009 Fundamentals publication. The proposed pre-installation leakage limits will help ensure that the deemed savings are an accurate reflection of the program's impacts and that the program focuses its efforts on scenarios where leakage conditions are likely to persist if unaddressed for several years.

Low-income customers<sup>72</sup> are exempt from the cap limiting the maximum pre-installation leakage rate to 35 percent of total fan flow.

While these baseline criteria were applied in deriving the deemed savings for the alternate approach (without duct leakage testing), it is not necessary to determine the pre-installation leakage rate for projects claiming the alternate deemed savings.

## High-Efficiency Condition

Materials used should be long-lasting materials, such as mastics, UL 181A or UL 181B approved foil tape or aerosol-based sealants. Fabric-based duct tape is not allowed.

The selected methodology for estimating duct sealing deemed savings according to the standard approach requires duct leakage-to-outside testing using a combination duct pressurization and house pressurization.

### ***Duct Leakage Testing (Standard Approach)***

Measurements to determine pre-installation and post-installation leakage rates must be performed in accordance with utility-approved procedures. For this measure, leakage-to-outside must be directly measured. The project sponsor shall use the Combination Duct Blaster™ (or

---

<sup>70</sup> *Total Fan Flow = Cooling Capacity (tons) × 400 cfm/ton*

<sup>71</sup> Based on data collected by Frontier Energy for investor-owned utilities in Texas.

<sup>72</sup> Low-income customers are income-eligible customers served through a targeted low-income energy efficiency program as described in 25.181(r). This may also apply to income-eligible customers served through a hard-to-reach program that is also delivered following the guidelines in 25.181(r).  
<https://www.puc.texas.gov/agency/ruleslaws/subrules/electric/25.181/25.181.pdf>.

equivalent) and blower door method. Prior to beginning any installations, the project sponsor must submit the intended method(s) and may be required to provide the utility with evidence of competency, such as Home Energy Rating System (HERS) or North American Technician Excellence (NATE) certification. Leakage rates must be measured and reported at the average air distribution system operating pressure (25 Pa).<sup>73</sup>

### ***Categorizing Achieved Duct Leakage Reduction (Absent Leakage Testing)***

Participating energy efficiency service providers (EESPs) electing not to perform leakage testing should nevertheless provide an estimate of the expected outcome of the leakage reduction work performed: projects should be characterized according to contractor estimation of whether the work required should result in a **low**, **average**, or **high reduction** in duct system leakage. EESPs should take the following considerations into account in assessing the likely leakage reduction achieved in a given project:

- The number and size of repaired leaks
- Leak location: a leak in an attic joint will cause more energy loss than a joint that leaks to conditioned space
- Supply/return: supply-side leaks, particularly in the return air plenum and near the air handling unit can be especially problematic, as they tend to draw additional unconditioned air into the system.

Systems that were not initially very leaky and in which few joints and supply vents were sealed should be characterized as low reduction. Jobs with a typical number of supply vents and joints sealed, and in which the supply air return or the return air plenum were sealed, should be characterized as average reduction. Jobs requiring significant interventions to eliminate large or numerous leaks should be considered high reduction.

The following table provides a guideline for selecting an appropriate leakage category. How the category is determined may fluctuate on a per-home basis.

<sup>74</sup> Based on typical distribution efficiency assumptions from the Building Performance Institute (BPI) Technical Standards for the Heating Professional, November 20, 2007, page 7.  
<http://www.bpi.org/sites/default/files/Technical%20Standards%20for%20the%20Heating%20Professional.pdf>.

<sup>75</sup> Catastrophic leaks are defined by BPI as disconnected ducts, missing end-caps, and other catastrophic holes.

## **Energy and Demand Savings Methodology**

Savings may be claimed according to either the standard approach (with duct leakage testing) or the alternate approach, according to the following sections.

### ***Standard Approach (with Duct Leakage Testing)***

The annual energy and summer and winter peak demand savings to be claimed according to the standard approach for this measure shall be calculated as a function of the reduction in duct leakage achieved, using the energy and demand savings coefficients from Table 26 through Table 28 for the climate zone in which the project was implemented and the type of heating equipment in the project home.

### **Savings Algorithms and Input Variables**

Calibrated simulation modeling was used to develop these deemed savings, which are expressed as linear functions of the reduction in duct leakage achieved (in CFM<sub>25</sub>). Specifically, these deemed savings estimates were developed using BEopt 2.6, running EnergyPlus 8.4 as the underlying simulation engine. To model this measure, the prototype home models for each climate zone were modified as follows: the base case duct leakage rate was set to 8 CFM<sub>25</sub> per 100 square feet. Results from running the base case model provide estimated hourly energy use for the prototypical home prior to treatment. Post-treatment conditions were simulated by setting the leakage rate to 6 CFM<sub>25</sub> per 100 square feet. Results from running the change case model provide estimated hourly energy use for the prototypical home after treatment. A comparison of these two runs provides the deemed savings estimates.

Deemed savings are presented as a function of the CFM<sub>25</sub> reduction achieved, as demonstrated by leakage to outside testing using the Combination Duct Blaster™ (or equivalent) and Blower Door method. The kWh and kW per CFM<sub>50</sub> values represented by the  $V_E$ ,  $V_S$ , and  $V_W$  coefficients are derived by taking the difference between annual energy use and summer and winter peak demand, as estimated by the two model runs and normalizing to the CFM<sub>25</sub> reduction achieved.

### **Deemed Energy Savings Tables**

Table 26 presents the annual energy savings per CFM<sub>25</sub> reduction for a residential duct sealing project. The following formula shall be used to calculate annual energy savings for duct leakage reduction:

$$\text{Deemed Energy Savings (kWh)} = (DL_{pre} - DL_{post}) \times V_E$$

**Equation 19**

Where:

$DL_{pre}$	=	Pre-improvement duct leakage at 25 Pa (cu. ft./min)
$DL_{post}$	=	Post-improvement duct leakage at 25 Pa (cu. ft./min)
$V_{E,C}$	=	Cooling Energy Savings Coefficient in Table 26
$V_{E,H}$	=	Heating Energy Savings Coefficient in Table 26

**Table 26. Duct Sealing—Energy Savings  $V_E$  per CFM<sub>25</sub> Reduction**

Region	$V_{E,C}$ : Cooling savings		$V_{E,H}$ : Heating savings		
	Refrigerated air	Evaporative cooling	Gas	Electric resistance	Heat pump
Zone 1: Panhandle	0.82	0.21	0.07	2.75	0.71
Zone 2: North	1.05	N/A	0.03	1.19	0.31
Zone 3: South	1.23	N/A	0.02	0.85	0.26
Zone 4: Valley	1.46	N/A	0.01	0.61	0.19
Zone 5: West	1.20	0.38	0.03	1.44	0.37

## Deemed Summer Demand Savings Tables

Table 27 presents the summer peak demand savings per CFM<sub>25</sub> reduction for a residential duct sealing project. The following formula shall be used to calculate deemed summer demand savings for duct leakage reduction:

$$\text{Deemed Summer Demand Savings (kW)} = (DL_{pre} - DL_{post}) \times V_S$$

**Equation 20**

Where:

- $DL_{pre}$  = Pre-improvement duct leakage at 25 Pa (cu. ft./min)
- $DL_{post}$  = Post-improvement duct leakage at 25 Pa (cu. ft./min)
- $V_S$  = Summer Demand Savings Coefficient in Table 27

**Table 27. Duct Sealing—Summer Demand Savings  $V_S$  per CFM<sub>25</sub> Reduction**

Region	Summer kW impact per CFM <sub>25</sub> reduction	
	Refrigerated air	Evaporative cooling
Climate zone 1: Panhandle	9.28E-04	2.29E-04
Climate zone 2: North	8.47E-04	N/A
Climate zone 3: South	1.06E-03	N/A
Climate zone 4: Valley	6.72E-04	N/A
Climate zone 5: West	7.66E-04	1.86E-04

## Deemed Winter Demand Savings Tables

Table 28 presents the winter peak demand savings per CFM<sub>25</sub> reduction for a residential duct sealing project. The following formula shall be used to calculate deemed winter demand savings for duct leakage reduction:

$$\text{Deemed Winter Demand Savings (kW)} = (DL_{pre} - DL_{post}) \times V_W$$

Equation 21

Where:

DL<sub>pre</sub> = Pre-improvement duct leakage at 25 Pa (cu. ft./min)

DL<sub>post</sub> = Post-improvement duct leakage at 25 Pa (cu. ft./min)

V<sub>W</sub> = Winter Demand Savings Coefficient in Table 28

Table 28. Duct Sealing—Winter Demand Savings V<sub>W</sub> per CFM<sub>25</sub> Reduction

Region	kWh impact per CFM <sub>25</sub> reduction		
	Gas	Resistance	Heat pump
Climate zone 1: Panhandle	4.38E-06	8.49E-04	1.46E-04
Climate zone 2: North	1.22E-06	9.96E-04	6.98E-04
Climate zone 3: South	8.60E-06	8.61E-04	5.02E-04
Climate zone 4: Valley	1.18E-05	6.71E-04	4.06E-04
Climate zone 5: West	6.68E-06	2.81E-04	6.69E-05

### Alternate Approach (No Duct Leakage Testing)

The following savings tables are provided for projects implemented without performing leakage testing, accounting for the application of pre-retrofit leakage caps to not hard-to-reach (HTR) projects. The annual energy and summer and winter peak demand savings to be claimed according to the alternate approach for this measure shall be taken from Table 26 through Table 28 for the climate zone in which the project was implemented and the type of heating equipment in the project home.

While savings for multiple duct systems are additive for the standard approach, the following savings are specified per home when using the alternate approach and should not be multiplied by the number of treated duct systems.

NOTE: This approach is only available to programs with an incentive structure that varies by leakage category. Additionally, energy efficiency service providers (EESPs) should not alternate between the standard and alternative approaches during the same program year. Utilities should either restrict all participants within an individual program to one approach or the other, or they should restrict individual EESPs to one approach or the other across all program types.

## Hard-to-Reach (HTR) and Targeted Low-Income Programs

**Claimed Peak Demand Savings**

Refer to Volume 1, Section 4 for further details on peak demand savings and methodology.

## Example Deemed Savings Calculation

**Example 1.** Using the **standard approach**, a 1,700 square foot home with a 3.5-ton central air conditioner and a gas furnace in Climate Zone 3 is found to have a pre-retrofit duct leakage rate of 600 CFM<sub>25</sub>. After sealing leaks, duct leakage is estimated at 100 CFM<sub>25</sub>. The project is completed in a non-HTR program.

$$\text{Max Initial Leakage Rate} = \left(400 \frac{\text{CFM}}{\text{ton}} \times 3.5 \text{ tons}\right) \times 35\% = 490 \text{ CFM}_{25}$$

$$\text{Reported Initial Leakage} = \text{Min} (600, 490) = 490 \text{ CFM}_{25}$$

$$DL_{pre} - DL_{post} = (490 - 100) = 390 \text{ CFM}_{25}$$

$$\text{kWh savings} = (1.23 + 0.02) \times 390 = 488 \text{ kWh}$$

$$\text{Summer kW savings} = 1.06 \times 10^{-3} \times 390 = 0.41 \text{ kW}$$

$$\text{Winter kW savings} = 8.60 \times 10^{-6} \times 390 = 0.003 \text{ kW}$$

**Example 2.** Using the **alternate approach**, a duct sealing project is completed on a home of any square footage with a central heat pump of any tonnage in Climate Zone 3. The duct system is categorized as 50-90% in conditioned space with an existing duct insulation value of R4-R7 and substantial leaks. Therefore, that home is categorized as an average leakage home. No leakage testing is performed. The project is completed in an HTR program. All savings are taken directly from deemed savings lookup tables.

$$\text{kWh savings} = 484 + 102 = 586 \text{ kWh}$$

$$\text{Summer kW savings} = 0.42 \text{ kW}$$

$$\text{Winter kW savings} = 0.20 \text{ kW}$$

## Additional Calculators and Tools

There is a calculator to estimate the energy and demand savings associated with this measure using the algorithms described in the previous subsection.

## Measure Life and Lifetime Savings

The estimated useful life (EUL) for a duct sealing measure is 18.0 years.

This value is consistent with the EUL reported in the 2014 California Database for Energy Efficiency Resources (DEER).<sup>76</sup>

---

<sup>76</sup> Database for Energy Efficiency Resources (DEER). <http://www.deeresources.com/>.

## **Program Tracking Data and Evaluation Requirements**

Primary inputs and contextual data that should be specified and tracked by the program database to inform the evaluation and apply the savings properly are:

- Climate zone
- Cooling Type (central refrigerated, evaporative cooling, none)
- Heating type (central gas furnace, central electric resistance furnace, heat pump, none)
  - Additional documentation is required to validate resistance heat (e.g., nameplate photo, utility inspection, or other evaluator-approved approach)
- Cooling capacity of home HVAC units (tons)

EESPs claiming savings according to duct leakage testing:

- Pre-improvement duct leakage at 25 Pa (cu. ft./min)
- Post-improvement duct leakage at 25 Pa (cu. ft./min)
- Pre- and post-photos of leakage test readings

EESPs claiming savings without performing leakage testing should provide:

- Description of the leakage severity in the home (low, average, or high)
- Description of location and condition of ducts:
  - Duct location (>90% conditioned, 50-90% conditioned, <50% conditioned)
  - Existing duct insulation value (>R7, R4-R7, <R4)
- Leakage characteristics (some observable leaks, substantial leaks, catastrophic leaks)
- Other relevant details that may assist with validating claimed leakage category (recommended)
- Description and photos of interventions taken (both pre and post condition), such as newly sealed joints, supply vents, and other relevant leaks sealed
- Incentive rate structure: incentive should be paid per home and should not vary by leakage category to avoid providing an incentive to overstate the existing leakage category.

### Document Revision History

Table 59. Residential Duct Efficiency Improvements Revision History

TRM version	Date	Description of change
v1.0	11/25/2013	TRM v1.0 origin.
v2.0	4/18/2014	TRM v2.0 update. Minor formatting changes, and language introduced to provide further direction for low-income customers and testing procedure. Contractors now required to track cooling capacity of HVAC equipment. Language added to reflect updates to federal standards for central heat pumps and central air conditioners.
v2.1	1/30/2015	TRM v2.1 update. Addition of language referring contractors to program manuals for information regarding health and safety precautions.
v3.0	4/10/2015	TRM v3.0 update. No revision.
v3.1	11/05/2015	TRM v3.1 update. Update of reference sources for air temperatures and densities, heating degree-days. Cooling demand savings required to be claimed.
v4.0	10/10/2016	TRM v4.0 update. Approach changed from algorithm-based to deemed savings coefficients estimated using building simulation models. Updated energy and demand savings. Added separate savings for homes with evaporative cooling. Updated measure description to eliminate eligibility for homes without a central AC, but with a ducted heating system.
v5.0	10/2017	TRM v5.0 update. Remove PY 2017 option to use energy and demand adjustment factors in combination with algorithm methodology from TRM v3.1. Added alternative approach to bypass the need to complete leakage testing in guidance memo to follow.
v6.0	11/2018	TRM v6.0 update. Added alternative approach to bypass the need to complete leakage testing in guidance memo to follow.
V7.0	10/2019	TRM v8.0 update. Added clarifying language on incentive rate per home.
v8.0	10/2020	TRM v8.0 update. Updated eligibility and documentation requirements for electric resistance heat.

## 2.2.3 Ground Source Heat Pumps Measure Overview

**TRM Measure ID:** R-HV-GH

**Market Sector:** Residential

**Measure Category:** HVAC

**Applicable Building Types:** Single-family, multifamily, manufactured

**Fuels Affected:** Electricity

**Decision/Action Type(s):** Replace-on-burnout, new construction

**Program Delivery Type(s):** Prescriptive

**Deemed Savings Type:** Deemed savings calculation

**Savings Methodology:** Engineering algorithms and estimates

### Measure Description

This measure requires the installation of a ground-source heat pump (GSHP) meeting the minimum requirements of ENERGY STAR® geothermal heat pump key product criteria. The deemed savings are dependent upon the energy efficiency rating (EER) and coefficient of performance (COP) of the installed equipment. Savings calculations are presented for systems with and without desuperheaters.

### Eligibility Criteria

The deemed savings apply to units with a capacity of  $\leq 65,000$  Btu/hour.

Energy savings for desuperheaters only apply if the desuperheater is attached to an electric storage water heater. The electric storage water heating cannot replace a gas water heater in a retrofit installation.

### Baseline Condition

The baseline unit is assumed to be an air-source heat pump (ASHP) for new construction, and either an ASHP or an air conditioner with an electric resistance furnace for replace-on-burnout projects. New construction baseline efficiency values for ASHPs are compliant with the current federal minimum standard,<sup>77</sup> effective January 1, 2015.

For replace-on-burnout (ROB) projects, the cooling baseline is reduced to 13.08 SEER. This value incorporates an adjustment to the baseline SEER value to reflect the percentage of current

---

<sup>77</sup> DOE minimum efficiency standard for residential air conditioners/heat pumps.

<https://www.energy.gov/eere/femp/incorporate-minimum-efficiency-requirements-heating-and-cooling-products-federal>

replacements that do not include the installation of an AHRI-matched system.<sup>78</sup> The heating baseline for replace-on-burnout projects is dependent on the heating type of the baseline equipment.

**Table 60. Ground Source Heat Pump Baseline Efficiencies**

Project type	Cooling mode <sup>79</sup>	Heating mode <sup>80</sup>
New Construction	11.8 EER (14 SEER)	2.4 COP (8.2 HSPF)
ROB—Air Source Heat Pump Baseline	11.2 EER (13.08 SEER)	2.4 COP (8.2 HSPF)
ROB— Air Conditioner with Electric Resistance Furnace Baseline		1 COP (3.412 HSPF)

## High-Efficiency Condition

Table 61 displays the ENERGY STAR® requirements for eligible geothermal heat pumps as of January 1, 2012. Energy efficiency service providers are expected to comply with the latest ENERGY STAR® requirements.

**Table 61. Ground Source Heat Pump ENERGY STAR® Requirements**

Product type	Cooling mode (EER)	Heating mode (COP)
Closed Loop Water-to-Air	17.1	3.6
Open Loop Water-to-Air	21.1	4.1
Closed Loop Water-to-Water	16.1	3.1
Open Loop Water-to-Water	20.1	3.5
Direct Geexchange (DGX)	16.0	3.6

The specifications in the charts above apply to single-stage models. Multi-stage models may be qualified based on:<sup>81</sup>

$$EER = (\text{highest rated capacity EER} + \text{lowest rated capacity EER}) \div 2$$

## **Energy and Demand Savings Methodology**

### **Savings Algorithms and Input Variables**

Peak demand and annual energy savings for GSHP systems should be calculated, as shown below. Where a desuperheater is also installed, please see the Deemed Energy Savings Tables section for additional energy savings and the Deemed Summer Demand Savings Tables for additional demand savings.

Energy and demand savings for desuperheaters were adapted from a 2001 study conducted by Oak Ridge National Laboratory (ORNL) on ground source heat pumps in Texas.<sup>82</sup> Desuperheater savings were calculated for each climate zone by taking the difference in savings between GSHPs with and without desuperheaters and averaging the savings between low and high-efficiency units. Savings for GSHP systems with desuperheaters should be calculated using the algorithms below with an additional energy credit based on the system capacity and efficiency.

The ORNL study draws from a 1998 analysis based on a study conducted at the Fort Polk Joint Readiness Training Center in Leesville, Louisiana. The Fort Polk study used calibrated simulations of 200 multifamily residences in the complex to estimate energy savings attributable to the replacement of air source heat pumps with ground source heat pumps. These estimates were found to be within 5 percent of actual post-retrofit savings. Building models were developed using TRNSYS.<sup>83</sup>

Using the Fort Polk models, the ORNL study assumed a baseline of a 1.5 ton, 10 SEER air source heat pump. Simulations of low-, medium-, and high-efficiency ground source heat pumps with and without desuperheaters were compared against the baseline unit. The models were run using TMY-2 weather profiles for climate zones 1-4. Energy and demand differences between the pre- and post-retrofit models were used to estimate average savings per ton of cooling capacity.

In the 1998 analysis, low-efficiency GSHPs were assumed to be units with an EER of 12.4 and capacity of 19 kBtuh, while medium-efficiency units had an EER of 16.8 and capacity of 21 kBtuh. High-efficiency units had an EER of 18.3, with a capacity of 22 kBtuh.

These models were used to derive the energy and demand savings associated with installation of a desuperheater along with a ground source heat pump, as shown in Table 64 and Table 65, respectively.

## Energy Savings Algorithms

$$kWh_{savings} = kWh_{savings,C} + kWh_{savings,H} + kWh_{desuperheater}$$

Equation 24

$$kWh_{savings,C} = CAP_C \times \frac{1 \text{ kW}}{1,000 \text{ W}} \times EFLH_C \times \left( \frac{1}{SEER_{Base}} - \frac{1}{EER_{GSHP}} \right)$$

Equation 25

$$kWh_{savings,H} = CAP_H \times \frac{1 \text{ kWh}}{1,000 \text{ Wh}} \times EFLH_H \times \left( \frac{1}{HSPF_{Base}} - \frac{1}{3.412 \times COP_{GSHP}} \right)$$

Equation 26

Where:

$kWh_{desuperheater}$  = Energy savings (kWh) associated with installation of a desuperheater (see Table 64). These savings should only be added if a desuperheater is installed.

$CAP_C$  = Rated equipment cooling capacity of the installed GSHP (Btu/hr)

$CAP_H$  = Rated equipment heating capacity of the installed GSHP (Btu/hr)

$EFLH_C$  = Equivalent full load hours for cooling)

$EFLH_H$  = Equivalent full load hours for heating (Table 62)

$EER_{Base}$  = Energy Efficiency Ratio of the baseline cooling equipment (Table 60)

$EER_{GSHP}$  = Energy Efficiency Ratio of the installed GSHP

$COP_{Base}$  = Coefficient of Performance of the baseline heating equipment (Table 60)

$COP_{GSHP}$  = Coefficient of Performance of the installed GSHP

**Table 62. Equivalent Full Load Cooling/Heating Hours<sup>84</sup>**

Climate Zone	EFLH <sub>C</sub>	EFLH <sub>H</sub>
Climate zone 1: Panhandle	1,142	1,880
Climate zone 2: North	1,926	1,343
Climate zone 3: South	2,209	1,127
Climate zone 4: Valley	2,958	776
Climate zone 5: West	1,524	1,559

### Demand Savings Algorithms

$$kW_{Savings,Summer} = CAP_C \times \frac{1 \text{ kW}}{1,000 \text{ W}} \times \left( \frac{1}{EER_{Base}} - \frac{1}{EER_{GSHP}} \right) \times CF_C + kW_{desuperheater}$$

**Equation 27**

$$kW_{Savings,Winter} = CAP_H \times \frac{1 \text{ kWh}}{3,412 \text{ Btu}} \times \left( \frac{1}{COP_{Base}} - \frac{1}{COP_{GSHP}} \right) \times CF_H$$

**Equation 28**

Where:

- $CAP_C$  = Rated equipment cooling capacity of the installed GSHP (Btu/hr)
- $CAP_H$  = Rated equipment heating capacity of the installed GSHP (Btu/hr)
- $EER_{Base}$  = Energy Efficiency Ratio of the baseline cooling equipment (Table 60)
- $EER_{GSHP}$  = Energy Efficiency Ratio of the installed GSHP
- $COP_{Base}$  = Coefficient of Performance of the baseline heating equipment (Table 60)
- $COP_{GSHP}$  = Coefficient of Performance of the installed GSHP
- $CF_C$  = Coincidence Factor = (Table 63)
- $CF_H$  = Coincidence Factor = (Table 63)
- $kW_{desuperheater}$  = Summer demand savings (kW) associated with installation of a desuperheater (see Table 65). These savings should only be added if a desuperheater is installed.

<sup>84</sup> ENERGY STAR® Central AC/HP Savings Calculator.

**Table 63. Ground Source Heat Pumps—Coincidence Factors for GSHPs<sup>85</sup>**

Season	Climate zone 1: Amarillo	Climate zone 2: Dallas	Climate zone 3: Houston	Climate zone 4: Corpus Christi	Climate zone 5: El Paso
Summer	0.634	0.677	0.626	0.583	0.725
Winter	0.549	0.478	0.515	0.453	0.437

Climate zone	kW/ton
Climate zone 1: Panhandle	0.440
Climate zone 2: North	0.405
Climate zone 3: South	0.405
Climate zone 4: Valley	0.410
Climate zone 5: West	0.405

## Deemed Winter Demand Savings Tables

There are no lookup tables available for this measure. See engineering algorithms in the previous section for calculating energy and demand savings.

Refer to Volume 1, Section 4 for further details on winter peak demand savings and methodology.

## Claimed Peak Demand Savings

Refer to Volume 1, Section 4 for further details on peak demand savings and methodology.

## Additional Calculators and Tools

Not applicable.

---

<sup>85</sup> See Volume 1

## **Measure Life and Lifetime Savings**

The estimated useful life (EUL) of a high-efficiency ground source heat pump unit is 20 years.

This value is consistent with the minimum life expectancy reported in the Department of Energy GSHP guide.<sup>86</sup>

## **Program Tracking Data and Evaluation Requirements**

It is required that the following list of primary inputs and contextual data be specified and tracked by the program database to inform the evaluation and apply the savings properly:

- Climate zone
- Decision/action type (new construction, replace-on-burnout)
- Replaced unit heating type (heat pump, electric resistance furnace)
  - Additional documentation is required to validate electric resistance heat (e.g., nameplate photo, utility inspection, or other evaluator-approved approach); sampling is allowed for multifamily complexes
- Installed GSHP type (closed loop water-to-air, open loop water-to-air, closed loop water-to-water, open loop water-to-water, direct geoexchange)
- Cooling and heating capacity (Btu/hr)
- Energy Efficiency Ratio (EER) of the new unit
- Coefficient of Performance (COP) of the new unit
- Whether a desuperheater was also installed or present
- Proof of purchase – with date of purchase and quantity
  - Alternative: photo of unit installed or other pre-approved method of installation verification
- Manufacturer, model, and serial number
  - AHRI certificate matching model number

## **References and Efficiency Standards**

## 2.2.4 Central Air Conditioner and Heat Pumps Measure Overview

**TRM Measure ID:** R-HV-CH

**Market Sector:** Residential

**Measure Category:** HVAC

**Applicable Building Types:** Single-family, multifamily, manufactured

**Fuels Affected:** Electricity

**Decision/Action Type(s):** Replace-on-burnout, early retirement, new construction

**Program Delivery Type(s):** Prescriptive, direct install (early retirement)

**Deemed Savings Type:** Look-up tables

**Savings Methodology:** Engineering spreadsheets and estimates

### Measure Description

Residential replacement of existing heating and cooling equipment with a new central air-source air conditioner (AC) or heat pump (HP) in an existing building, or the installation of a new central AC or HP in a new residential construction. Downsized systems that are right-sized per heat load calculation are also eligible. A new central system includes an entire packaged unit or a split system consisting of an indoor unit with a matching remote condensing unit. This measure also applies to the installation of dual-fuel HPs that meet all existing measure eligibility criteria.

### Eligibility Criteria

Newly installed units must have a cooling capacity of less than 65,000 Btu/hour (5.4 tons) to be eligible for these deemed savings. Gas furnaces are not eligible to be awarded savings for replacement through this measure.

Equipment shall be properly sized to dwelling based on ASHRAE or ACCA Manual J standards. Manufacturer datasheets for installed equipment or documentation of AHRI or DOE CCMS certification must be provided<sup>87,88</sup>. Savings should be calculated using rated capacities whenever possible. Reported system capacities and efficiencies should always match those verified by AHRI or DOE as tested under AHRI operating conditions for a specific combination of equipment, including condenser, coil, and furnace (or condenser only for packaged units). Savings should never be calculated using efficiency ratings for individual system components.

Customers should be advised against using the emergency heat (EM HEAT) setting on heat pump thermostats. This setting is meant only for use in emergency situations when the heat pump is damaged or malfunctioning. Supplemental heating automatically kicks on below freezing conditions using the regular HEAT setting. Contractors installing a new heat pump thermostat with equipment install shall advise customer of correct thermostat usage.

---

<sup>87</sup> Air-Conditioning, Heating, and Refrigeration Institute (AHRI) Directory: <https://www.ahridirectory.org/>.

<sup>88</sup> Department of Energy Compliance Certification Management System (DOE CCMS): <https://www.regulations.doe.gov/certification-data/>.

For early retirement or rightsizing projects, attempt to determine the rated capacity of the existing unit. The rated capacity may be found on the manufacturer specification sheet for the existing unit if the new system is not available on the AHRI or DOE CCMS directories. If the model number of the existing unit is unobtainable or if the manufacturer specification sheet cannot be found, use nominal tonnage for both the existing and new unit. Never use nominal tonnage for the existing unit in combination with rated tonnage for the new unit, which can lead to overstated savings. Additionally, never use nominal tonnage to determine savings for projects where no early retirement or rightsizing has occurred.

For early retirement projects, to receive savings, the unit to be replaced must be functioning at the time of removal with a maximum age of 24 years for ACs and 20 years for HPs. Otherwise, claim savings for a replace-on-burnout project.

The replacement of an evaporative cooler with a central system is eligible where the decision to change equipment types predates or is independent of the decision to install efficient equipment and should be claimed against the new construction baseline.

The replacement of a room air conditioner with a central air conditioner or heat pump is eligible and should be claimed against the new construction baseline. Refer to the Replace-on-burnout or Early Retirement of an Electric Resistance Furnace section for guidance about the appropriate heating baseline for residences with electric resistance heat.

New construction projects are not eligible to receive deemed savings for system rightsizing.<sup>89</sup> For system upsizing, savings should generally be claimed against the new construction baseline. However, when upsizing while going from a single larger capacity system to multiple smaller capacity systems, savings may be claimed against the applicable replace-on-burnout or early retirement baseline if the total pre and post tonnage are within ½ ton.<sup>90</sup> For this scenario, savings must be looked up using the lower pre-tonnage. If the multiple installed units do not share the same efficiency value, savings should be looked up using the most conservative efficiency value.

Additionally, low-income or hard-to-reach programs may use the electric resistance baseline for the following two scenarios. The electric resistance baseline may be used for systems upsized by no more than a half-ton in lieu of the new construction baseline. Under this scenario, cooling savings should be claimed against the new construction baseline using the installed (higher) capacity. Heating savings should be claimed against the electric resistance baseline using the existing (lower) capacity. Documentation should be aligned with the rightsizing

and electric resistance baseline requirements outlined in this measure. The second scenario is for a major multifamily renovation when a centralized system, such as a boiler, is replaced with individual heat pumps. For this scenario, the electric resistance baseline may be claimed in lieu of new construction only if the building owner can document intent to install electric resistance furnaces without program intervention. The cooling savings should still be claimed against the new construction baseline. Documentation should follow early retirement and electric resistance baseline requirements..

---

<sup>89</sup> For projects using a custom baseline see TRM Volume 4.

<sup>90</sup> This exception is allowed to account for efficiency improvements due to zoning that are not reflected in the current savings methodology.

When replacing a single unit with multiple units where the capacity is the same or has been downsized, savings should be looked up using the total system pre and post capacities. Again, if the multiple installed units do not share the same efficiency value, savings should be looked up using the most conservative efficiency value.

## Baseline Condition

### ***New Construction, Replace-on-Burnout, or Early Retirement of an Air-Source AC or HP***

New construction baseline efficiency values for ACs or HPs are compliant with the current federal minimum standard,<sup>91</sup> effective January 1, 2015. The baseline is assumed to be a new system with an AHRI-listed SEER rating of 14.0. This baseline is also applicable to central HP installations replacing ACs with central gas heat, evaporative coolers with central, space, or no heating, or room/window ACs with central, space, or no heating.

For replace-on-burnout (ROB) projects, the cooling baseline is reduced to 13.08 SEER. This value incorporates an adjustment to the baseline SEER value to reflect the percentage of current replacements that do not include the installation of an AHRI-matched system.<sup>92</sup>

For early retirement (ER) projects, the cooling baseline is reduced to 10 SEER for systems installed before January 23, 2006. For systems installed on or after January 23, 2006, the ER baseline increases to 12.44 SEER. Systems manufactured as of January 1, 2015 are not eligible for early retirement.

For ROB projects, heating baseline efficiency values for HPs are compliant with the current federal minimum standard, effective January 1, 2015. These standards specify an HSPF of 8.2 for split systems and 8.0 for packaged systems. This baseline reflects updates to federal standards that take effect on January 1, 2015, as defined in the Department of Energy (DOE) energy efficiency standards (10 CFR Part 430).<sup>93</sup> For ER projects where the existing system was installed on or after January 23, 2006, the heating baseline efficiency is assumed to be an HSPF of 7.7 based on the federal minimum standard in effect from January 23, 2006, through December 31, 2014.<sup>94</sup> For ER projects where the existing system was installed before January 23, 2006, the heating baseline efficiency is reduced to 6.8 HSPF based on the federal minimum standard in effect prior to January 23, 2006.

Available: <http://www.gpo.gov/fdsys/pkg/CFR-2012-title10-vol3/pdf/CFR-2012-title10-vol3-sec430-32.pdf>. Accessed February 2014.

<sup>94</sup> Ibid.

## ***Replace-on-Burnout or Early Retirement of an Electric Resistance Furnace***

Electric resistance heating baselines may refer to residences heated by a centralized forced-air furnace or by individual space heaters.<sup>95</sup> Space heating primarily refers to electric baseboard zonal heaters controlled by thermostats or to portable plug-load heaters.<sup>96</sup> Electric resistance heat controlled by a wall thermostat is eligible to claim the deemed savings presented in this measure. Homes with portable space heaters should calculate savings using a heat pump baseline.

By the nature of the technology, all electric resistance furnaces have the same efficiency with HSPF = 3.41.<sup>97</sup> Projects in which an electric resistance furnace is replaced, either in replace-on-burnout or early retirement scenarios, use this baseline for heating-side savings.

For ROB projects, cooling savings are the same as for new construction and ROB of an air-source HP. For early retirement (ER) projects, the cooling baseline is reduced to 10 SEER for systems installed before January 23, 2006. For systems installed on or after January 23, 2006, the ER baseline increases to 12.44 SEER.

**Table 67. Central AC/HPs – Baseline Efficiencies**

<b>Project type</b>	<b>Cooling mode</b>	<b>Heating mode</b>
New construction	14 SEER	8.2 HSPF
Replace-on-burnout, heat pump	13.08 SEER	8.2 HSPF
Replace-on-burnout, electric resistance furnace		3.41 HSPF
Early retirement, heat pump (manufactured as of 1/23/2006)	12.44 SEER	7.7 HSPF
Early retirement, electric resistance furnace (manufactured as of 1/23/2006 through 12/31/2014)		3.41 HSPF
Early retirement, heat pump (manufactured before 1/23/2006)	10 SEER	6.8 HSPF
Early retirement, electric resistance furnace (manufactured before 1/23/2006)		3.41 HSPF

## **High-Efficiency Condition**

Table 68 displays the Consortium for Energy Efficiency (CEE) requirements for eligible Tier 1 HPs as of January 1, 2009. Energy efficiency service providers are expected to at least comply with the latest CEE Tier 1 requirements.

No full-load efficiency requirement is specified in the current federal standard. Therefore, systems with qualifying SEER and HSPF energy ratings are permitted to claim cooling energy savings, heating energy savings, and winter demand savings for systems where the EER does not comply with the below requirement.

<sup>95</sup> Electric Resistance Heating: <https://www.energy.gov/energysaver/home-heating-systems/electric-resistance-heating>.

<sup>96</sup> Portable Heaters: <https://www.energy.gov/energysaver/home-heating-systems/portable-heaters>.

<sup>97</sup> COP = HSPF × 1,055 J/BTU / 3,600 J/W-hr. For Electric Resistance, heating efficiency is 1 COP. Therefore, HSPF = 1 × 3,600 / 1,055 = 3.41.

**Table 68. Central AC/HPs—CEE Tier 0 Requirements<sup>98</sup>**

SEER	EER	HSPF
14.5	12.0	8.5

Split system efficiencies are driven primarily by the efficiency of the condenser unit. If the paired outdoor and indoor units are not listed on the AHRI certification listing and only provide DOE CCMS testing results, then the capacity and efficiency of the high efficient condition shall not exceed the average of the AHRI certification listing pairing for the matching condenser. The DOE CCMS listing provides documentation of the results that are on the AHRI certification listing and can be downloaded and filtered based on listing using a similar condenser and various indoor units.

## **Energy and Demand Savings Methodology**

### **Savings Algorithms and Input Variables**

#### ***Replace-on-Burnout or New Construction***

Energy, summer demand, and winter demand savings were estimated using AC and HP performance curves developed by the National Renewable Energy Laboratory<sup>99</sup> for typical units in each of the following SEER ranges:

- Baseline units
- 14.5–14.9
- 15.0–15.9
- 16.0–16.9
- 17.0–17.9
- 18.0–20.9
- 21.0 and above

14.5–16.9 SEER units were assumed to be single stage. 17.0 and above SEER units were assumed to be multi-stage cooling units.

These performance curves provide the capacity and efficiency of the ACs and HPs operating in cooling mode across a wide range of outside air temperatures. Unit loading was estimated as a function of outside air temperature, and hours of cooling mode operation under different loadings were estimated using bin weather data for each weather zone. In heating mode, predicted HVAC operation was limited to meeting 77 percent of load, using a factor applied in Manual J to correlate design load hours to equivalent full load hours under actual operating

<sup>98</sup> CEE Residential High Efficiency Central Air Conditioners and Air Source Heat Pumps Specification, January 1, 2015. <https://library.cee1.org/content/cee-residential-high-efficiency-central-air-conditioners-and-air-source-heat-pumps-specifica>.

<sup>99</sup> D. Cutler et al. Improved Modeling of Residential Air Conditioners and Heat Pumps for Energy Calculations. National Renewable Energy Laboratory. NREL/TP-5500-56354. January 2013. Tables 12 and 13. <http://www.nrel.gov/docs/fy13osti/56354.pdf>

conditions. This approach accounts for the observation that heating systems are not always operated even when outdoor conditions indicate they should.

Summer and winter demand savings were estimated according to the expected unit performance under design conditions. For all weather zones, it is assumed that typical HVAC systems are sized to 115 percent of their design cooling load (oversized by 15 percent). Heating mode capacity was related to rated cooling capacity using the rated capacity in the cooling and heating mode of the residential market HP products of four major manufacturers according to data exported from AHRI. Data were exported from the AHRI directory, and the average ratio for each equipment size of heating capacity to cooling capacity was multiplied by the rated (cooling side) capacity to estimate the HP capacity. HP system output was then compared to its loading under design conditions.

The model used the following set of normalized performance curves to scale the rated performance values as a function of outdoor dry-bulb temperature ranging from 65 to 115 degrees Fahrenheit. The total capacity and Energy Input Ratio (EIR = 1/COP) curves are a function of entering wet-bulb temperature (EWB) and outdoor dry-bulb temperature (ODB) and are both quadratic curve fits of the form:

$$y = a + b \times T_{EWB} + c \times T_{EWB}^2 + d \times T_{ODB} + e \times T_{ODB}^2 + f \times T_{EWB} \times T_{ODB}$$

To estimate the baseline SEER value for retrofit installations, Texas A&M’s Energy Systems Laboratory (ESL) surveyed dealers across the State to determine installation practices. The research found that in the event of a compressor failure out of warranty, dealers replaced the compressor 11.7 percent of the time, and replaced the condensing unit 88.3 percent of the time. Further, the condensing unit replacements consist of condensing unit-only replacements, replacements with mismatched evaporator coils, and replacements with matching evaporator coils. The percentages for these installations are as follows:

Figure 1: Central AC/HPs—Unit Replacement Percentages upon Compressor Failure

Source: Docket No. 36780

<sup>101</sup> Using air conditioner capacity EIR coefficients for heat pump cooling savings.

To calculate a weighted average SEER for these installations, ESL assumed that a compressor-only replacement resulted in no increase in SEER and that the SEER of a condensing unit installed without a matching coil would be 85 percent of the SEER value for a matched system. The ESL estimate of the baseline SEER for replacement AC units is given by the following equation:

$$SEER_{Base} = (SEER_{Compressor\ Replacement}) \times (Actual\ \% \ Compressor\ Replacement) + (SEER_{Condenser\ Replacement}) \times (Actual\ \% \ Condenser\ Replacement) + (SEER_{System\ Replacement}) \times (Actual\ \% \ System\ Replacement)$$

**Equation 30**

Substituting ESL SEER estimates and survey data provides the following baseline SEER estimate:

$$SEER_{Base} = (9.5) \times (11.7\%) + (11.05) \times (24.1\%) + (13.5) \times (64.2\%) = 12.44$$

Adjusting for the increased 14 SEER baseline:

$$SEER_{Base} = (10.5) \times (11.7\%) + (11.9) \times (24.1\%) + (14) \times (64.2\%) = 13.08$$

In new construction, there is no possibility of a partial system (e.g., condensing unit-only) change out, so the 13.08 baseline would not be appropriate. Therefore, the baseline for new construction installations is set at the federal government's minimum efficiency standard of 14 SEER.

### **Early Retirement**

Annual energy (kWh) and summer peak demand (kW) savings must be calculated separately for two time periods:

1. The estimated remaining life of the equipment that is being removed, designated the remaining useful life (RUL), and
2. The remaining time in the EUL period (EUL—RUL)

Annual energy and summer peak demand savings are calculated by weighting the early retirement and replace-on-burnout savings by the RUL of the unit and the remainder of the EUL period, as outlined in the Volume 3 appendices.

Where:

**RUL** = Remaining Useful Life (see Table 71 or Table 72) or if unknown, assume the age of the replaced unit is equal to the EUL resulting in a default RUL of 8.0 (ACs) or 6.0 years (HPs). If individual system components were installed at separate times, use the condenser age as a proxy for the entire system. Default RUL may be used exclusively if applied consistently for all projects. Otherwise, the default should only be used when a project is reported and documented as having a nameplate that is illegible. For HPs replacing an AC with an electric resistance furnace, use the RUL table from the Central AC measure instead.

**EUL** = Estimated Useful Life = 18 years (AC); 15 years (HP)

**Table 71. Central AC/HPs—Remaining Useful Life of Replaced AC<sup>102</sup>**

Age of replaced unit (years)	Remaining useful life (years)	Age of replaced unit (years)	Remaining useful life (years)
1	16.8	14	8.6
2	15.8	15	8.2

11	9.8	24	1.0
12	9.4	25 <sup>103,104</sup>	0.0
13	9.0		

<sup>102</sup> Current federal standard effective date is 1/1/2015. Existing systems manufactured after this date are not eligible to use the early retirement baseline and should use the ROB baseline instead.

<sup>103</sup> RULs are capped at the 75<sup>th</sup> percentile of equipment age, 25 years, as determined based on DOE survival curves (see Figure 2). Systems older than 25 years should use the ROB baseline. See the January 2015 memo, "Considerations for early replacement of residential equipment," for further detail.

<sup>104</sup> Ward, B., Bodington, N., Farah, H., Reeves, S., and Lee, L. "Considerations for early replacement of residential equipment." Prepared by the Evaluation, Measurement, and Verification (EM&V) team for the Electric Utility Marketing Managers of Texas (EUMMOT). January 2015. This document has been made available to Texas investor-owned utilities through the EM&V team's SharePoint.

Table 72. Central AC/HPs—Remaining Useful Life of Replaced HP<sup>105</sup>

Age of replaced unit (years)	Remaining useful life (years)	Age of replaced unit (years)	Remaining useful life (years)
1	13.7	12	7.9
2	12.7	13	7.6
3	12.0	14	7.0
4	11.3	15	6.0
5	10.7	16	5.0
6	10.2	17	4.0
7	9.7	18	3.0
8	9.3	19	2.0
9	8.9	20	1.0
10	8.5	21 <sup>106,107</sup>	0.0
11	8.2		

### Derivation of RULs

Central ACs have an estimated useful life of 18 years, and central HPs have an estimated useful life of 15 years. This estimate is consistent with the age at which approximately 50 percent of the central ACs and HPs installed in a given year will no longer be in service, as described by the survival function Figure 2 and Figure 3.

<sup>105</sup> Current federal standard effective date is 1/1/2015. Existing systems manufactured after this date are not eligible to use the early retirement baseline and should use the ROB baseline instead.

<sup>106</sup> RULs are capped at the 75<sup>th</sup> percentile of equipment age, 21 years, as determined based on DOE survival curves (Figure 3). Systems older than 21 years should use the ROB baseline. See the January 2015 memo, “Considerations for early replacement of residential equipment,” for further detail.

<sup>107</sup> Ward, B., Bodington, N., Farah, H., Reeves, S., and Lee, L. “Considerations for early replacement of residential equipment.” Prepared by the Evaluation, Measurement, and Verification (EM&V) team for the Electric Utility Marketing Managers of Texas (EUMMOT). January 2015. This document has been made available to Texas investor-owned utilities through the EM&V team’s SharePoint.

Figure 2. Central AC/HPs—Survival Function for Central ACs<sup>108</sup>

Figure 3. Central AC/HPs—Survival Function for Central HPs<sup>109</sup>

<sup>108</sup> Department of Energy, Federal Register, 76 FR 37408, Technical Support Document: 8.2.3.5 Lifetime. June 2011. Download TSD at: <http://www.regulations.gov/#!documentDetail;D=EERE-2011-BT-STD-0011-0012>.

<sup>109</sup> Ibid.

The method for estimating the remaining useful life (RUL) of a replaced system uses the age of the existing system to re-estimate the projected unit lifetime based on the survival function shown in Figure 3. The age of the system being replaced is found on the horizontal axis, and the corresponding percentage of surviving system is determined from the chart. The surviving percentage value is then divided in half, creating a new estimated useful lifetime applicable to the current unit age. The age (year) that corresponds to this new percentage is read from the chart. RUL is estimated as the difference between that age and the current age of the system being replaced.

## **Deemed Energy Savings Tables<sup>110</sup>**

Due to the high volume of tables associated with this measure, deemed savings tables are provided in an appendix at the end of this volume.<sup>111</sup>

## **Deemed Summer Demand Savings Tables<sup>112</sup>**

Due to the high volume of tables associated with this measure, deemed savings tables are provided in an appendix at the end of this volume.<sup>113</sup>

## **Deemed Winter Demand Savings Tables<sup>114</sup>**

Due to the high volume of tables associated with this measure, deemed savings tables are provided in an appendix at the end of this volume.<sup>115</sup>

## **Claimed Peak Demand Savings**

Refer to Volume 1, Section 4 for further details on peak demand savings and methodology.

## **Additional Calculators and Tools**

Not applicable.

---

<sup>110</sup> Rated capacity ranges are specified based on normal rounding convention between capacity categories (values at and above the midpoint round up, while values below the midpoint round down).

<sup>111</sup> Savings tables are also provided in Excel format at the Texas Efficiency website.  
<http://texasefficiency.com/index.php/regulatory-filings/deemed-savings>.

<sup>112</sup> Rated capacity ranges are specified based on normal rounding convention between capacity categories (values at and above the midpoint round up, while values below the midpoint round down).

<sup>113</sup> Savings tables are also provided in Excel format at the Texas Efficiency website.  
<http://texasefficiency.com/index.php/regulatory-filings/deemed-savings>.

<sup>114</sup> Rated capacity ranges are specified with a 5 percent tolerance in accordance with AHRI Standard 210/240 to account for systems that are rated slightly below the applicable nominal capacity. AHRI Standard 210/240. Table J1.  
[http://www.ahrinet.org/App\\_Content/ahri/files/STANDARDS/AHRI/AHRI\\_Standard\\_210-240\\_2017.pdf](http://www.ahrinet.org/App_Content/ahri/files/STANDARDS/AHRI/AHRI_Standard_210-240_2017.pdf).

<sup>115</sup> Savings tables are also provided in Excel format at the Texas Efficiency website.  
<http://texasefficiency.com/index.php/regulatory-filings/deemed-savings>.

## Measure Life and Lifetime Savings

The estimated useful life (EUL) is 18 years for a central AC and 15 years for a central HP unit based on the current DOE Final Rule standards for central ACs and HPs.<sup>116</sup>

This value is consistent with the EUL reported in the Department of Energy 76 Final Rule 37408 Technical Support Document for Energy Conservation Standards for Air Conditioners and Heat Pumps.<sup>117</sup>

## Program Tracking Data and Evaluation Requirements

Primary inputs and contextual data that should be specified and tracked by the program database to inform the evaluation and apply the savings properly are:

- Climate zone
- Decision/action type (early retirement, replace-on-burnout, new construction)
- Cooling/heating capacity of the newly installed unit (btuh)
- Seasonal Energy Efficiency Ratio (SEER) and Energy Efficiency Ratio (EER) of the newly installed unit
- Heating Seasonal Performance Factor (HSPF) of the newly installed unit (HPs only)
- Type of unit replaced (AC with gas furnace, AC with electric resistance furnace, air source HP)
  - Baseline equipment used for savings (if different from unit replaced)
  - Additional documentation is required to validate electric resistance heat (e.g., nameplate photo, utility inspection, or other evaluator-approved approach); sampling is allowed for multifamily complexes
- Type of unit installed (central AC, central HP, dual-fuel HP)
- Age of the replaced unit (early retirement only)
- Retired or replaced heating unit model number, serial number, manufacturer, and heating capacity (electric resistance only)

---

<sup>116</sup> Final Rule: Standards, Federal Register, 76 FR 37408 (June 27, 2011) and associated Technical Support Document. Accessed 10/21/2014.  
[http://www1.eere.energy.gov/buildings/appliance\\_standards/product.aspx/productid/75](http://www1.eere.energy.gov/buildings/appliance_standards/product.aspx/productid/75). Download TSD at: <http://www.regulations.gov/#!documentDetail;D=EERE-2011-BT-STD-0011-0012>.

<sup>117</sup> Department of Energy, Federal Register, 76 FR 37408, Technical Support Document: 8.2.3.5 Lifetime. June 2011.

- Retired cooling unit model number, serial number, manufacturer, and cooling capacity (early retirement or rightsizing)
  - Photograph of retired unit nameplate (early retirement, rightsizing, or electric resistance baseline)
  - If a photograph of the retired unit nameplate is unavailable or not legible, provide estimated square footage of conditioned area served by the retired unit (rightsizing only)
- Photograph demonstrating functionality of existing equipment and/or customer responses to survey questionnaire documenting the condition of the replaced unit and their motivation for measure replacement for early retirement eligibility determination (early retirement only)
- If replacing an evaporative cooler, application should include a statement that the customer decision to change equipment types predates or is independent of the decision to install efficient equipment
- Proof of purchase – with date of purchase and quantity
  - Alternative: photo of unit installed or other pre-approved method of installation verification
- Manufacturer, model, and serial number of newly installed unit
  - AHRI/DOE CCMS certificate or reference number matching manufacturer and model number

## Document Revision History

Table 73. Residential Central Heat Pumps Revision History

TRM version	Date	Description of change
v1.0	11/25/2013	TRM v1.0 origin.
v2.0	4/18/2014	TRM v2.0 update. Low-income and hard-to-reach Market Transformation section merged with main measure as "early retirement" option. Updated by Frontier Energy, March 2014, based on new federal standards.
v2.1	1/30/2015	TRM v2.1 update. No revision.
v3.0	4/10/2015	TRM v3.0 update. early retirement savings may be claimed through any appropriately designed program in accordance with EM&V team's memo, "Considerations for early replacement of residential equipment." Remaining useful lifetimes updated.
v3.1	11/05/2015	TRM v3.1 update. Revision of cooling savings to reflect heat-pump-specific performance curves. Extension of early retirement cooling savings tables to higher SEER values. Clarification around summer demand savings for single-stage and two-stage units.
v4.0	10/10/2016	TRM v4.0 update. Added RUL value for units with an age of one year. Added a default RUL value for when the age of the unit is unknown. Eliminated the eligibility requirement of the existing unit to have a minimum age of five years. Updated savings for 15.0-15.9 SEER range.
v5.0	10/2017	TRM v5.0 update. Switched to air conditioner capacity and EIR curve coefficients for estimated heat pump cooling savings. Updated energy savings to use TMY3 temperature bin hours. Updated demand savings for compliance with current peak definition. Added 12.44 SEER and 6.8 HSPF baseline savings tables previously referencing earlier version of TRM. Updated baseline to include replacing air conditioners with gas heat.
v6.0	11/2018	TRM v6.0 update. Updated baseline and eligibility requirements. Added rightsizing savings for replace on burnout in winter demand tables. Added language clarifying use of rated capacity vs nominal and updated the deemed savings tables to show rated Btuh. Clarified required documentation for early retirement.
v7.0	10/2019	TRM v7.0 update. Consolidated central air conditioner and heat pump measures. Moved deemed savings tables to Appendix A. Updated eligibility for low-income and hard-to-reach.
v8.0	10/2020	TRM v8.0 update. Clarified early retirement age eligibility. Updated electric resistance baseline documentation.

## 2.2.5 Mini-Split Air Conditioners and Heat Pumps Measure Overview

**TRM Measure ID:** R-HV-MS

**Market Sector:** Residential

**Measure Category:** HVAC

**Applicable Building Types:** Single-family, multifamily, manufactured

**Fuels Affected:** Electricity

**Decision/Action Type(s):** Replace-on-burnout, early retirement, new construction

**Program Delivery Type(s):** Prescriptive, direct Install (early retirement)

**Deemed Savings Type:** Look-up tables

**Savings Methodology:** Engineering spreadsheets and estimates

### Measure Description

Residential replacement of existing heating and cooling equipment with a new mini-split air conditioner (AC) or heat pump (HP) in an existing building, or the installation of a new mini-split air conditioner or HP in a new residential construction. Downsized systems that are right-sized per a heat load calculation are also eligible. This measure also applies to the installation of DC inverter systems that meet all existing measure eligibility criteria.

Additional savings may be available for duct removal in combination with the installation of a ductless mini-split. In these cases, refer to the Duct Sealing measure and follow the savings methodology (standard approach) using a value of 0 CFM as the post-improvement duct leakage. Leakage testing must be performed on the existing ductwork to claim savings for duct removal.

### Eligibility Criteria

Newly installed units must have a cooling capacity of less than 65,000 Btu/hour (5.4 tons) to be eligible for these deemed savings. Gas furnaces are not eligible to be awarded savings for replacement through this measure.

Equipment shall be properly sized to dwelling based on ASHRAE or ACCA Manual J standards. Manufacturer datasheets for new equipment or documentation of AHRI or DOE CCMS certification must be provided<sup>119,120</sup>. Savings should be calculated using rated capacities whenever possible. Reported system capacities and efficiencies should always match those verified by AHRI or DOE as tested under AHRI operating conditions for a specific combination of equipment, including condenser, coil, and furnace (or condenser only for packaged units). Savings should never be calculated using efficiency ratings for individual system components.

---

<sup>119</sup> Air-Conditioning, Heating, and Refrigeration Institute (AHRI) Directory: <https://www.ahridirectory.org/>.

<sup>120</sup> Department of Energy Compliance Certification Management System (DOE CCMS): <https://www.regulations.doe.gov/certification-data/>.

Customers should be advised against using the emergency heat (EM HEAT) setting on heat pump thermostats. This setting is meant only for use in emergency situations when the heat pump is damaged or malfunctioning. Supplemental heating automatically kicks on below freezing conditions using the regular HEAT setting. Contractors installing a new heat pump thermostat with equipment install shall advise customer of correct thermostat usage.

For early retirement or rightsizing projects, attempt to determine the rated capacity of the existing unit. The rated capacity may be found on the manufacturer specification sheet for the existing unit if the new system is not available on the AHRI or DOE CCMS directories. If the model number of the existing unit is unobtainable or if the manufacturer specification sheet cannot be found, use nominal tonnage for both the existing and new unit. Never use nominal tonnage for the existing unit in combination with rated tonnage for the new unit, which can lead to overstated savings. Additionally, never use nominal tonnage to determine savings for projects where no early retirement or rightsizing has occurred.

For early retirement projects, to receive savings, the unit to be replaced must be functioning at the time of removal with a maximum age of 24 years for ACs and 20 years for HPs. Otherwise, claim savings for a replace on burnout project.

The replacement of a room air conditioner with a central air conditioner or heat pump is eligible and should be claimed against the new construction baseline. Refer to the Replace-on-burnout or Early Retirement of an Electric Resistance Furnace section for guidance about the appropriate heating baseline for residences with electric resistance heat.

Replacement of an evaporative cooler with a mini-split system is eligible where the decision to change equipment types predates or is independent of the decision to install efficient equipment and should be claimed against the new construction baseline.

New construction projects are not eligible to receive deemed savings for system rightsizing.<sup>121</sup> For system upsizing, savings should generally be claimed against the new construction baseline. However, when upsizing while going from a single larger capacity system to multiple smaller capacity systems, savings may be claimed against the applicable replace-on-burnout or early retirement baseline if the total pre and post tonnage are within ½ ton.<sup>122</sup> For this scenario, savings must be looked up using the lower pre-tonnage. If the multiple installed units do not share the same efficiency value, savings should be looked up using the most conservative efficiency value.

Additionally, low-income or hard-to-reach programs may use the electric resistance baseline for the following two scenarios. The electric resistance baseline may be used for systems upsized by no more than a half-ton in lieu of the new construction baseline. Under this scenario, cooling savings should be claimed against the new construction baseline using the installed (higher) capacity. Heating savings should be claimed against the electric resistance baseline using the existing (lower) capacity. Documentation should be aligned with the rightsizing and electric resistance baseline requirements outlined in this measure. The second scenario is for a major multifamily renovation when a centralized system, such as a boiler, is replaced with individual heat pumps. For this scenario, the electric resistance baseline may be claimed in lieu of new construction only if the building owner can document intent to install electric resistance furnaces

---

<sup>121</sup> For projects using a custom baseline see TRM Volume 4.

<sup>122</sup> This exception is allowed to account for efficiency improvements due to zoning that are not reflected in the current savings methodology.

without program intervention. The cooling savings should still be claimed against the new construction baseline. Documentation should follow early retirement and electric resistance baseline requirements.

When replacing a single unit with multiple units where the capacity is the same or has been downsized, savings should be looked up using the total system pre and post capacities. Again, if the multiple installed units do not share the same efficiency value, savings should be looked up using the most conservative efficiency value.

## Baseline Condition

### ***New Construction, Replace-on-Burnout, or Early Retirement of an Air-Source AC or HP***

New construction baseline efficiency values for ACs or HPs are compliant with the current federal minimum standard,<sup>123</sup> effective January 1, 2015. The baseline is assumed to be a new system with an AHRI-listed SEER rating of 14.0. This baseline is also applicable to central HP installations replacing ACs with central gas heat, evaporative coolers with central, space, or no heating, or room/window ACs with central, space, or no heating.

For replace-on-burnout (ROB) projects, the cooling baseline is reduced to 13.08 SEER. This value incorporates an adjustment to the baseline SEER value to reflect the percentage of current replacements that do not include the installation of an AHRI-matched system.<sup>124</sup>

For early retirement (ER) projects, the cooling baseline is reduced to 10 SEER for systems installed before January 23, 2006. For systems installed on or after January 23, 2006, the ER baseline increases to 12.44 SEER. Systems manufactured as of January 1, 2015 are not eligible for early retirement.

For ROB projects, heating baseline efficiency values for HPs are compliant with the current federal minimum standard, effective January 1, 2015. These standards specify an HSPF of 8.2 for split systems, or 8.0 for packaged systems. This baseline reflects updates to federal standards that took effect on January 1, 2015, as defined in the Department of Energy (DOE) energy efficiency standards (10 CFR Part 430).<sup>125</sup> For ER projects where the existing system was installed on or after January 23, 2006, the heating baseline efficiency is assumed to be an HSPF of 7.7 based on the federal minimum standard in effect from January 23, 2006, through December 31, 2014.<sup>126</sup> For ER projects where the existing system was installed before January

<sup>126</sup> Ibid.

23, 2006, the heating baseline efficiency is reduced to 6.8 HSPF based on the federal minimum standard in effect prior to January 23, 2006.

### ***Replace-on-Burnout or Early Retirement of an Electric Resistance Furnace***

Electric resistance heating baselines may refer to residences heated by a centralized forced-air furnace or by individual space heaters.<sup>127</sup> Space heating primarily refers to electric baseboard zonal heaters controlled by thermostats or to portable plug-load heaters.<sup>128</sup> Electric resistance heat controlled by a wall thermostat is eligible to claim the deemed savings presented in this measure. Homes with portable space heaters should calculate savings using a heat pump baseline.

By the nature of the technology, all electric resistance furnaces have the same efficiency with HSPF = 3.41.<sup>129</sup> Projects in which an electric resistance furnace is replaced, either in replace-on-burnout or early retirement scenarios, use this baseline for heating-side savings.

For ROB projects, cooling savings are the same as for new construction and ROB of an air-source HP. For early retirement (ER) projects, the cooling baseline is reduced to 10 SEER for systems installed before January 23, 2006. For systems installed on or after January 23, 2006, the ER baseline increases to 12.44 SEER.

**Table 74. Mini-Split AC/HPs—Baseline Efficiencies**

<b>Project type</b>	<b>Cooling mode</b>	<b>Heating mode</b>
New construction	14 SEER	8.2 HSPF
Replace-on-burnout, heat pump	13.08 SEER	8.2 HSPF
Replace-on-burnout, electric resistance furnace		3.41 HSPF
Early retirement, heat pump (as of 1/23/2006)	12.44 SEER	7.7 HSPF
Early retirement, electric resistance furnace (as of 1/23/2006)		3.41 HSPF
Early retirement, heat pump (before 1/23/2006)	10 SEER	6.8 HSPF
Early retirement, electric resistance furnace (before 1/23/2006)		3.41 HSPF

### **High-Efficiency Condition**

Table 68 displays the Consortium for Energy Efficiency (CEE) requirements for eligible Tier 1 systems as of January 1, 2009. Energy efficiency service providers are expected to at least comply with the latest CEE Tier 1 requirements.

No full-load efficiency requirement is specified in the current federal standard. Therefore, systems with qualifying SEER and HSPF energy ratings are permitted to claim cooling energy savings, heating energy savings, and winter demand savings for systems where the EER does not comply with the below requirement.

<sup>127</sup> Electric Resistance Heating: <https://www.energy.gov/energysaver/home-heating-systems/electric-resistance-heating>.

<sup>128</sup> Portable Heaters: <https://www.energy.gov/energysaver/home-heating-systems/portable-heaters>.

<sup>129</sup> COP = HSPF × 1,055 J/BTU / 3,600 J/W-hr. For Electric Resistance, heating efficiency is 1 COP. Therefore, HSPF = 1 × 3,600 / 1,055 = 3.41.

**Table 75. Mini-Split AC/HPs— System CEE Tier 0 Requirements<sup>130</sup>**

SEER	EER	HSPF
14.5	12.0	8.5

Split system efficiencies are driven primarily by the efficiency of the condenser unit. -If the paired outdoor and indoor units are not listed on the AHRI certification listing and only provide DOE CCMS testing results, then the capacity and efficiency of the high efficient condition shall not exceed the average of the AHRI certification listing pairing for the matching condenser. -The DOE CCMS listing provides documentation of the results that are on the AHRI certification listing and can be downloaded and filtered based on listing using a similar condenser and various indoor units.

## **Energy and Demand Savings Methodology**

### **Savings Algorithms and Input Variables**

#### ***Replace-on-Burnout or New Construction***

Energy, summer demand, and winter demand savings were estimated using the AC and HP performance curves developed by the National Renewable Energy Laboratory<sup>131</sup> for typical units in each of the following SEER ranges:

- Baseline units
- 14.5–14.9
- 15.0–15.9
- 16.0–16.9
- 17.0–17.9
- 18.0–20.9
- 21.0 and above

14.5–16.9 SEER units were assumed to be single stage. 17.0 and above SEER units were assumed to be multi-stage cooling units.

These performance curves provide the capacity and efficiency of the ACs and HPs operating in cooling mode across a wide range of outside air temperatures. Unit loading was estimated as a function of outside air temperature, and hours of cooling mode operation under different loadings were estimated using bin weather data for each weather zone. In heating mode, predicted HVAC operation was limited to meeting 77 percent of load, using a factor applied in

<sup>130</sup> CEE Residential High Efficiency Central Air Conditioners and Air Source Heat Pumps Specification, January 1, 2015. <https://library.cee1.org/content/cee-residential-high-efficiency-central-air-conditioners-and-air-source-heat-pumps-specifica>.

<sup>131</sup> D. Cutler et al. Improved Modeling of Residential Air Conditioners and Heat Pumps for Energy Calculations. National Renewable Energy Laboratory. NREL/TP-5500-56354. January 2013. Tables 12 and 13. <http://www.nrel.gov/docs/fy13osti/56354.pdf>

Manual J to correlate design load hours to equivalent full load hours under actual operating conditions. This approach accounts for the observation that heating systems are not always operated even when outdoor conditions indicate they should.

Summer and winter demand savings were estimated according to the expected unit performance under design conditions. For all weather zones, it is assumed that typical HVAC systems are sized to 115 percent of their design cooling load (oversized by 15 percent). Heating mode capacity was related to rated cooling capacity using the rated capacity in the cooling and heating mode of the residential market HP products of four major manufacturers according to data exported from AHRI. Data was exported from the AHRI directory, and the average ratio for each equipment size of heating capacity to cooling capacity was multiplied by the rated (cooling side) capacity to estimate the HP capacity. HP system output was then compared to its loading under design conditions.

The model uses the following set of normalized performance curves to scale the rated performance values as a function of outdoor dry-bulb temperature ranging from 65 to 115 degrees Fahrenheit. The total capacity and Energy Input Ratio (EIR = 1/COP) curves are a function of entering wet-bulb temperature (EWB) and outdoor dry-bulb temperature (ODB) and are both quadratic curve fits of the form:

$$y = a + b \times T_{EWB} + c \times T_{EWB}^2 + d \times T_{ODB} + e \times T_{ODB}^2 + f \times T_{EWB} \times T_{ODB}$$
