<b>APPLICATION OF ENTERGY TEXAS, INC. FOR AUTHORITY TO CHANGE RATES AND RECONCILE FUEL COSTS</b>	<b>§</b> <b>§</b> <b>§</b> <b>§</b>	<b>BEFORE THE STATE OFFICE OF ADMINISTRATIVE HEARINGS</b>
--	--	---

**RESPONSE OF ENTERGY TEXAS, INC.  
TO STAFF'S TWENTY-THIRD REQUEST FOR INFORMATION:  
STAFF 23: 1, 2, 3, AND 4**

Entergy Texas, Inc. ("Entergy Texas" or "the Company") files its Response to STAFF's Twenty-Third Request for Information. The response to such request is attached and is numbered as in the request. An additional copy is available for inspection at the Company's office in Austin, Texas.

Entergy Texas believes the foregoing response is correct and complete as of the time of the response, but the Company will supplement, correct or complete the response if it becomes aware that the response is no longer true and complete, and the circumstance is such that failure to amend the answer is in substance misleading. The parties may treat this response as if it were filed under oath.

Respectfully submitted,

Steven H. Neinast /3V18  
Steven H. Neinast  
Entergy Services, Inc.  
919 Congress Avenue, Suite 840  
Austin, Texas 78701  
(512) 487-3957 telephone  
(512) 487-3958 facsimile

Attachments: STAFF 23: 1, 2, 3 AND 4

**CERTIFICATE OF SERVICE**

I certify that a copy of the foregoing Response of Entergy Texas, Inc. to STAFF's Twenty-Third Request for Information has been sent by either hand delivery, facsimile, overnight delivery, or U.S. Mail to the party that initiated this request in this docket on this the 27<sup>th</sup> day of December, 2013.

Steven H. Neinast /3V18  
Steven H. Neinast

ENTERGY TEXAS, INC.  
PUBLIC UTILITY COMMISSION OF TEXAS  
PUC DOCKET NO. 41791

Response of: Entergy Texas, Inc.

to the Twenty-Third Set of Data Requests  
of Requesting Party: Commission Staff

Prepared By: Brandon T. Bradberry/  
Tuongvi Tran/David Haslauer  
Sponsoring Witness: Gerard Fontenot  
Beginning Sequence No. WG 691  
Ending Sequence No. WG 698

---

Question No.: STAFF 23-1

Part No.:

Addendum:

Question:

Please refer to Exhibit GLF-4 of the direct testimony of Gerard L. Fontenot where it reflects the following projects that were closed to plant in service for Nelson Unit 6 and address the questions below:

C6PPWGM649	NL6 - Generator Stator Rewind	Nelson Coal Unit 6-Joint Owner - NL6 - EGSI - 1886
C6PPWGM701	NL6 Rplc Lower Coutant Slope	Nelson Coal Unit 6-Joint Owner - NL6 - EGSI - 1886
C6PPWGM638	NL6- RplcReheatPlatenPendantAssembly	Nelson Coal Unit 6-Joint Owner - NL6 - EGSI - 1886
C6PPWGM732	NL6-Rplc5RowsLPTurbineBlades	Nelson Coal Unit 6-Joint Owner - NL6 - EGSI - 1886

- a. Please discuss each of the four projects above and explain why these projects were needed.
- b. Please provide an itemized list of expenses that make up the total amount for each of the four projects above and include a description and cost for each item.
- c. For each of the projects above please provide the dollar amount each of the ownership partners were responsible for and include their respective percentage of the total project cost.
- d. Please explain if each of the project cost amounts for ETI shown in Exhibit GLF-4 for the Nelson-6 unit are 29.75% (ETI's ownership percentage of the unit) of the total project cost. If not, please explain why this is not the case and identify those projects.
- e. Please explain if and when similar work to any of the four projects identified above was last conducted on Nelson unit 6. If similar work has been done in the past, please justify the need for having to do it again.
- f. Please identify the FERC account to which all Nelson-6 expenses shown in Exhibit GLF-4 were charged.

- g. Please discuss and identify any litigation expenses incurred in the last five (5) years regarding the Nelson-6 unit and identify the FERC account to which they were charged.
- 

Response:

- a. The four projects are discussed below:

#### **C6PPWG701-NL6-Generator Stator Rewind**

Justification – Only option besides rewind was continued operation with high potential for catastrophic failure.

- The unit was placed in commercial service on 2/21/1982. The generator performed fairly well over its life expectancy of thirty years with the exception of a ground fault in 1997 and a temporary repair which has also exceeded the life expectancy of that repair. Recommendation for rewind timeframe was for the next major outage (2012) and not to exceed two years were derived from a review of the maintenance history of this generator in 2010.
- Inspection and testing of the generator in 2010 indicated broken and loose blocking of winding support and lead support systems. There was wear on all six lead box bushings and lead connections from lead box bushing to winding. There was also strand damage at the B phase neutral lead connection called T5 at the 12:00 position. These areas were repaired with new spacers, additional layers of tape or voids filled with wicking epoxy resin to restore support and insulation. The core of the stator was found to be very loose and required torqueing of the thru-bolts, building bolts and bore rings. During the 2012 rewind, it was discovered that additional core iron needed to be added due to the condition of the machine.
- Because of the existing damage and the root cause (age and vibration); re-grouting the generator base, rewinding the stator, replacing the bushings and current transformers was recommended for the generator to be qualified for another 30 years of service.
- Due to the chronic effects caused by the high vibration of the generator, it was expected that the condition of the generator would continue to deteriorate. If nothing was done to correct the vibration and the results of the vibration, it could have lead to catastrophic failure, thus rendering the unit not able to run for a very long period of time.
- The project included rewinding with 100% new copper, the replacement of the rotor's retaining & zone rings from 18-5 to 18-18, boresonic inspection, high speed balance testing, generator rotor return to site and installed.

#### **C6PPWG701-NL6-Rplc Lower Coutant Slope**

Justification – Only option besides replacement was continued operation with existing tubes resulting in increased Unit EFOR. Perform necessary repairs as failures occur.

- The construction of the furnace bottom is an open hopper type which allows the ash and slag from the furnace to be discharged out of the bottom of the furnace into an ash hopper and conveying system. In this type of bottom, the front and rear water-walls slope toward the center of the furnace forming two inclined sides called coutant slopes. The ash and slag from the furnace travels down the slope to an opening in the center where it is discharged into bottom ash hoppers leading to the clinker grinders and ash handling system. A water level is maintained in the hoppers to reduce impact damage, create an air seal, and form a slurry in the ash conveying system. The coutant slopes are impacted heavily by falling ash buildups or clinkers from the division panels and furnace water-walls. The coutant slope tubes are designed with reinforcing rods to help protect the tube surfaces and break-up the clinkers. The size and hardness of the slag formations are often dictated by the fuel types. The lower slopes of Nelson Plant's Unit 6 were becoming damaged and eroded due to the boiler's heavy slagging. The tubes and support system of the lower slope were deformed and in need of replacement.
- The front and rear lower coutant slope tubes were fully scaffold during the 2009 outage, to allow an ultrasonic thickness scan survey across the width of the furnace and to perform a close visual inspection at six foot elevations. The ultrasonic thickness readings were taken at two foot intervals from the base of the slope to the vertical wall. The ultrasonic inspection revealed that the tube were experiencing some external wastage from sliding ash on the slope face as well as pitting and gouging in isolated locations throughout the slope faces. Visual inspections were performed by OEM inspectors and the following is their recommendations.
  - The lower slopes are in average to poor condition overall. The slopes have taken a number of large clinker hits over the years, including one this past year that caused a tube leak into the lower dead air space. There are large depressed areas on both slopes, numerous "high" and "intermediate" priority dents and gouges, and too many "moderate" priority dents to document. On the lower dead air space side of the slopes, several horizontal buckstays are bent, some severely, and numerous clips have broken off. This is also indication of the rough treatment these slopes have endured. It would be a good idea for the plant to consider total replacement of the lower slopes, including the support steel in back, within the next couple of years.
  - It is recommended that the lower slopes be replaced during the 2011 Unit Outage. Additional repairs were needed during the 2010 outage to help reduce the possibility of forced outages during yearly operation. Replacement plans were to replace the front and rear lower slopes from the lower drum hanger assemblies on the waterwall to the back side of the seal skirt assemblies in the bottom ash hoppers.
- During 2008 operation, two forced outages were caused by failures in the lower slope with numerous tubes being replaced during each outage. The

majority of the tubes that were replaced were leaking at gouged and pitted locations in the tube. A major failure occurred during 2008 when a lower slope tube ruptured pressurizing the dead air space behind the lower slope and expelling high pressure steam to the exterior of the boiler. During this failure, lagging and insulation were blown across the walkways and decks on the front side of the boiler structure. If replacement of the lower slope is not completed there is an increased risk of similar failures occurring during unit operation. When this type of failure occurs there are immediate risks of damages to unit equipment and personnel.

Force Outage History:

Jan 2003 Forced Outage

Duration – 50 hrs.

Lost Generation – 27,500 MWh

Jan 2004 Forced Outage

Duration – 72 hrs

Lost Generation – 39,600 MWh

Oct 2008 Forced Outage

Duration – 140 hrs

Lost Generation – 77,000 MWh

Apr 2009 Forced Outage

Duration – 32.75 hrs

Lost Generation – 18,012.5 MWh

Dec 2010 Forced Outage

Duration – 42.60 hrs

Lost Generation – 23,430 MWh

**C6PPWG638-NL6- RplcReheatPlatenPendantAssembly**

Justification – Only option besides replacement was continued operation with existing reheater. Perform annual inspections and repairs. Make repairs to Unit as failures occur throughout the year, which will increase Unit EFOR.

- The reheat pendant platens are vertical hanging panels located in the upper region of the firebox above the nose arch of the boiler. The reheat pendant assemblies are segmented into two separate sets of panels designated by location and service-reheat pendant front pendants and reheat finishing section. There are fifty-one reheat pendant front assemblies which are located on the firebox side of the reheat section extending from the top of the nose arch to the roof of the boiler. The reheat finishing section is made up of one hundred and two assemblies which are located near the roof of the reheat area above the nose arch slope in the back-pass. The two sets of reheat assemblies are connected to each other by the crossover tubes in the reheat crow's nest.

The steam flow comes through the reheat front assembly to the crossovers and into the reheat finishing assemblies.

- During 2004 operation, four forced outages were caused by failures in the lower bends of the reheat pendant assemblies. During each of the forced outages, multiple tubes were replaced. The failed tubes were sent out for analysis and the failure mechanism determined to be long-term overheating and high temperature oxidation. During the April 2005 unit outage, OEM inspection groups examined selected reheater components to determine the future serviceability. State-of-the-art inspection techniques were utilized by experienced individuals to examine and assess the condition of the selected reheater components. Condition assessment was based on visual examinations, wall thickness measurements, internal oxide scale thickness measurements, and outside diameter measurements. The condition assessment report provided to Entergy integrates the findings from Alstom Technical Service department, Alstom Condition Assessment Services group, and the Alstom Materials Technology Center. The reheat front pendant assemblies were found to be suitable for continued service for the near term of 3-5 years. During the 2008 outage, additional scaffolding was provided for a closer inspection of the reheat components. The most significant finding was the long-term overheating of the differential metal welds (DMW) and tubing in the crossover tubes in the crow's nest area. By design, the reheat crossovers contain differential metal welds which allow the material to transition from a chrome alloy in the reheat front assembly to a stainless in the reheat finishing assemblies. The differential metal welds were approaching the end of their designed lifespan of approximately twenty years. A DMW sample was removed and sent to the Alstom Material Technology Center for destructive analysis. Basic finds indicated creep damage and oxide grooving in the ferritic tubing. These are typical long-term failure mechanisms for this area of the boiler. During the NL6 Spring 2008 Outage boiler inspection, it was also discovered that the rear wall hanger tubes and reheat crossover tubes are exhibiting signs of external wall loss due to soot-blower erosion. It is recommended that the front pendant assemblies be replaced from the reheat inlet header to the crossover tube assemblies.
- Significant failures in the lower bends of the reheat section of the boiler began occurring in 2004. Analysis of these failures indicated the failure mechanism to be long term overheating and high temperature oxidation.
  - Lost MegaWatt Hours Due to Reheat Failures (2004-2009)
  - 2004        125,601.7     LMWH
  - 2005        49,142.5     LMWH
  - 2006        128,935.7     LMWH
  - 2007        106,976     LMWH
  - 2009        134,383.3     LMWH
  - Total       545,039.2     LMWH
- Inspections have been performed annually. The 2008 inspection indicated long-term overheating of the DMW and tubing in the crossover tubes in the crow's nest. The DMW's were approaching the end of their designed lifespan of approximately twenty years. Sample analysis of the DMW's indicated

creep damage and oxide grooving in the ferritic tubing. These are typical long-term failure mechanisms for this area of the boiler.

- 2008 inspection also indicated that the rear wall hanger tubes and reheat crossover tubes are exhibiting signs of external wall loss due to soot-blower erosion.
- 2004 – 2009 Lost Megawatt hours due to Reheater Failures: 545,039.2
- 2008 Inspection recommendation was for replacement in 3 – 5 years.

#### **C6PPWG732-NL6- Rplc5RowsLPTurbineBlades**

Justification – Only option besides replacement of damaged blades was continued operation with existing blades, which would have led to future blade failures and increased Unit EFOR.

- Nelson 6 was removed from service on 1/6/13 due to a vibration event and subsequent water chemistry issues (condenser tube leak). Inspection of the 'A' LP Turbine revealed two L-1 blade failures. One section, nearly 12" long liberated and was the likely cause of the vibration event. Another blade was found cracked. There were also three adjacent L-1 blades that were twisted as well as collateral damage to several L-0 blades.
- Due to failure of blades in the LP Turbine, the L-0 blades on LP 'A' on the governor end needed to be replaced. After further inspection of the LP 'A' and LP 'B' turbines, it was determined that the L-1 blade rows on the governor and generator end require replacement due to corrosive elements discovered at the location of the failure, resulting in pitting of the blades. It was the recommendation of both the OEM and Entergy Management that all four sets of L-1 blades be replaced.

- b. See the spreadsheet "TP-41791-00PUS023-X001-b.xlsx" on the attached CD.
- c. Refer to chart below:

The TX000 portion ties to the response for Staff 23-1b "Co-Owner Allocation Costs".

Costs of Project C6PPWGM638 (excluding, AFUDC Equity, AFUDC Debt & Capital Suspense, AWP)

		Nelson Holding	SRG&T	ETEC	Total
TX000	LG000				
29.75%	40.25%	10.90%	10.00%	9.10%	100.00%
1,846,732.74	2,498,520.76	676,618.05	620,750.50	564,882.95	6,207,505.00

Costs of Project C6PPWGM649 (excluding AFUDC Equity, AFUDC Debt & Capital Suspense, AWP)

		Nelson Holding	SRG&T	ETEC	Total
TX000	LG000				
29.75%	40.25%	10.90%	10.00%	9.10%	100.00%
4,496,748.80	6,083,836.62	1,647,548.30	1,511,512.20	1,375,476.10	15,115,122.02

Costs of Project C6PPWGM701 (excluding AFUDC Equity, AFUDC Debt & Capital Suspense, AWP)

		Nelson Holding	SRG&T	ETEC	Total
TX000	LG000				
29.75%	40.25%	10.90%	10.00%	9.10%	100.00%
2,247,599.43	3,040,869.82	823,490.21	755,495.61	687,501.00	7,554,956.08

Costs of Project C6PPWGM732 (excluding AFUDC Equity, AFUDC Debt & Capital Suspense, AWP)

		Nelson Holding	SRG&T	ETEC	Total
TX000	LG000				
29.75%	40.25%	10.90%	10.00%	9.10%	100.00%
1,263,178.13	1,709,005.71	462,811.48	424,597.69	386,383.90	4,245,976.92

- d. The portion of the costs identified in response to sub-part b as "Co-Owner Allocation Cost" and Fringe Benefits Loader were allocated to ETI at 29.75% for all four projects. The Removal Cost Adjustment, AFUDC Equity, AFUDC Debt and Capital Suspense were additional amounts booked based on the balances and activities on ETI's books, not relating to the transactions that occurred on EGSL's books and therefore not allocated the 29.75%.
- e. Of the four mentioned projects, the only one that had similar work performed in the past was C6PPWGW732-NL6- Rplc5RowsLPTurbineBlades.
  - Nelson 6's LP turbine has a history of L-1 blade failures resulting in collateral damage to other L-1 and L-0 blades as well as condenser tubes. In 1996, all four L-1 blades rows were replaced. In 2006/2007 all four rows were replaced again. The 2013 failure resulted in all four rows being replaced once again.
  - 1996 LP 'A' & LP 'B'
    - The L-1 blades on both ends were found to have cracks extending through the shroud from the blade tenons. The old L-1 blades and shroud were removed from the rotor and scrapped. The new L-1 blades were the freestanding blade design with no shroud. This was considered a blade upgrade being that the freestanding design was used.
  - 2006 – LP 'A' Generator End: L-1 Blade failure (3" above platform)

- Replaced complete row of L-1 blades on LP 'A'
- 2007 – Planned Replacement based on 2006 Failure Report
  - LP 'A': Governor End L-1, New Blades
  - LP 'B': Both Ends L-1, New Blades
- 2013 – LP 'A' L-1 blade failure
  - Replaced all 4 rows L-1 (LP 'A' & 'B') and one row of L-0 (collateral damage in LP 'A').
- Root Cause
  - The root cause determinations for the past failures have been Corrosion-assisted fatigue (CAF). A damage mechanism referring to the formation of cracks from corrosives deposited on the material and dynamic stresses from blade vibration, accumulated during hours of unit operation or during unit cycling.

#### Corrective Actions

- Short Term
  - Continued DEA Maintenance as identified in 2012 inspection (trays, nozzles, level adjustments)
  - Adjustment of Drum Level
  - Inspection/Renewal of all Superheat/Reheat Spray Nozzles to ensure proper operation
  - Investigate operational means to reduce spray flow
  - Installation of metal transport monitoring analyzers
  - Purchase and install a Degas Cation Analyzer per 2013 recommendations by Technical Support Group
  - Installation of Ammonia Flowmeter to Enhance Automation
  - Identify source of sulfides and chlorides and address
  - Develop monthly report to include key parameters that need to be monitored to mitigate turbine deposits
- Longer Term - Condensate Filtration

- f. Please see the spreadsheet "TP-41791-00PUS023-X001-f.xlsx" on the attached CD.
- g. There were no litigation expenses incurred in the last five years regarding the Nelson-6 unit.

Question No.: STAFF 23-2

Part No.:

Addendum:

Question:

Please explain if each of the project cost amounts for ETI shown in Exhibit GLF-4 for Big Cajun unit 3 are 17.85% (ETI's ownership percentage of the unit) of the total project cost. If not, please explain why this is not the case and identify those projects.

---

Response:

The Big Cajun costs allocated to ETI (based on billings received from NRG dba Big Cajun) were properly allocated between ETI and EGSL, resulting in 17.85% allocation of total Big Cajun unit 3 to ETI. Included in GLF-4, however, are amounts for AFUDC Equity, AFUDC Debt and Capital Suspense that were recorded on ETI's books based on the balances and activities on ETI's books, not directly relating to the activities of EGSL or Big Cajun, and therefore not allocated based on 17.85% ownership.

Question No.: STAFF 23-3

Part No.:

Addendum:

Question:

Please refer to ETI's response to Staff 13-10 regarding the \$2,834,082 purchase of land for the Ponderosa switching station and a proposed 230kV substation and address the following:

- a. Besides the 19 acres for the substation and the 15 acres for the proposed substation, please discuss how many acres of the remaining land is planned to be used for right-of-way (ROW), including transmission or distribution line ROW.
  - b. Please provide an itemized list of expenses that equate to the \$2,834,082 land purchase amount.
  - c. Please explain ETI's status regarding the Ponderosa switching station construction and explain when the facility is planned to be in service.
  - d. Please explain ETI's plans regarding the proposed 230kV substation, describe the steps that have already been taken for the proposed facility, and explain when the facility is planned to be in service.
  - e. Please explain why ETI did not have the land appraised before purchasing.
  - f. According to Attachment 1 below, the Montgomery County Appraisal District market value for the 143 acres in 2013 is \$478,530. Please explain what steps ETI took to ensure that the purchase price was fair market value for the property.
- 

Response:

- a. In addition to the acreage being used for the switching station and proposed 230 kV substation, approximately 7.2 acres of land will be used for roadway access and approximately 4.9 acres of land is currently expected to be used for transmission line right-of-way. The total acreage used for transmission line right-

Question No.: STAFF 23-3

of-way is subject to change, as the transmission line project is still in the design phase.

- b. The following expenses comprise the \$2,834,082 land purchase amount:

Contracts	\$88,938
ROW/Other	\$1,964,531
Labor & Expenses	\$60,059
Overheads	\$720,554
<b>Total</b>	<b>\$2,834,082</b>

- c. The Ponderosa Switching Station was placed in service on December 17, 2013.
- d. The proposed Ponderosa 230 kV substation is currently in the scoping phase and has a proposed in-service date of November 15, 2015. The substation will be built to include a new 230-138 kV 3-phase autotransformer, a 230 kV breaker, and a 138 kV breaker in preparation for the 230 kV transmission line to be built from the Ponderosa Substation in Conroe, TX, to the Grimes Substation in Shiro, TX (the “Ponderosa-to-Grimes Line”). The Ponderosa-to-Grimes Line has a proposed in-service date of June 1, 2016, and is currently the subject of PUC Docket No. 41718.
- e. Prior to purchasing the land at issue, ETI performed a market analysis, which included comparable sales data. This market analysis suggested that the ultimate price per acre paid by the Company was reasonable and in line with the price per acre paid recently for comparable properties.

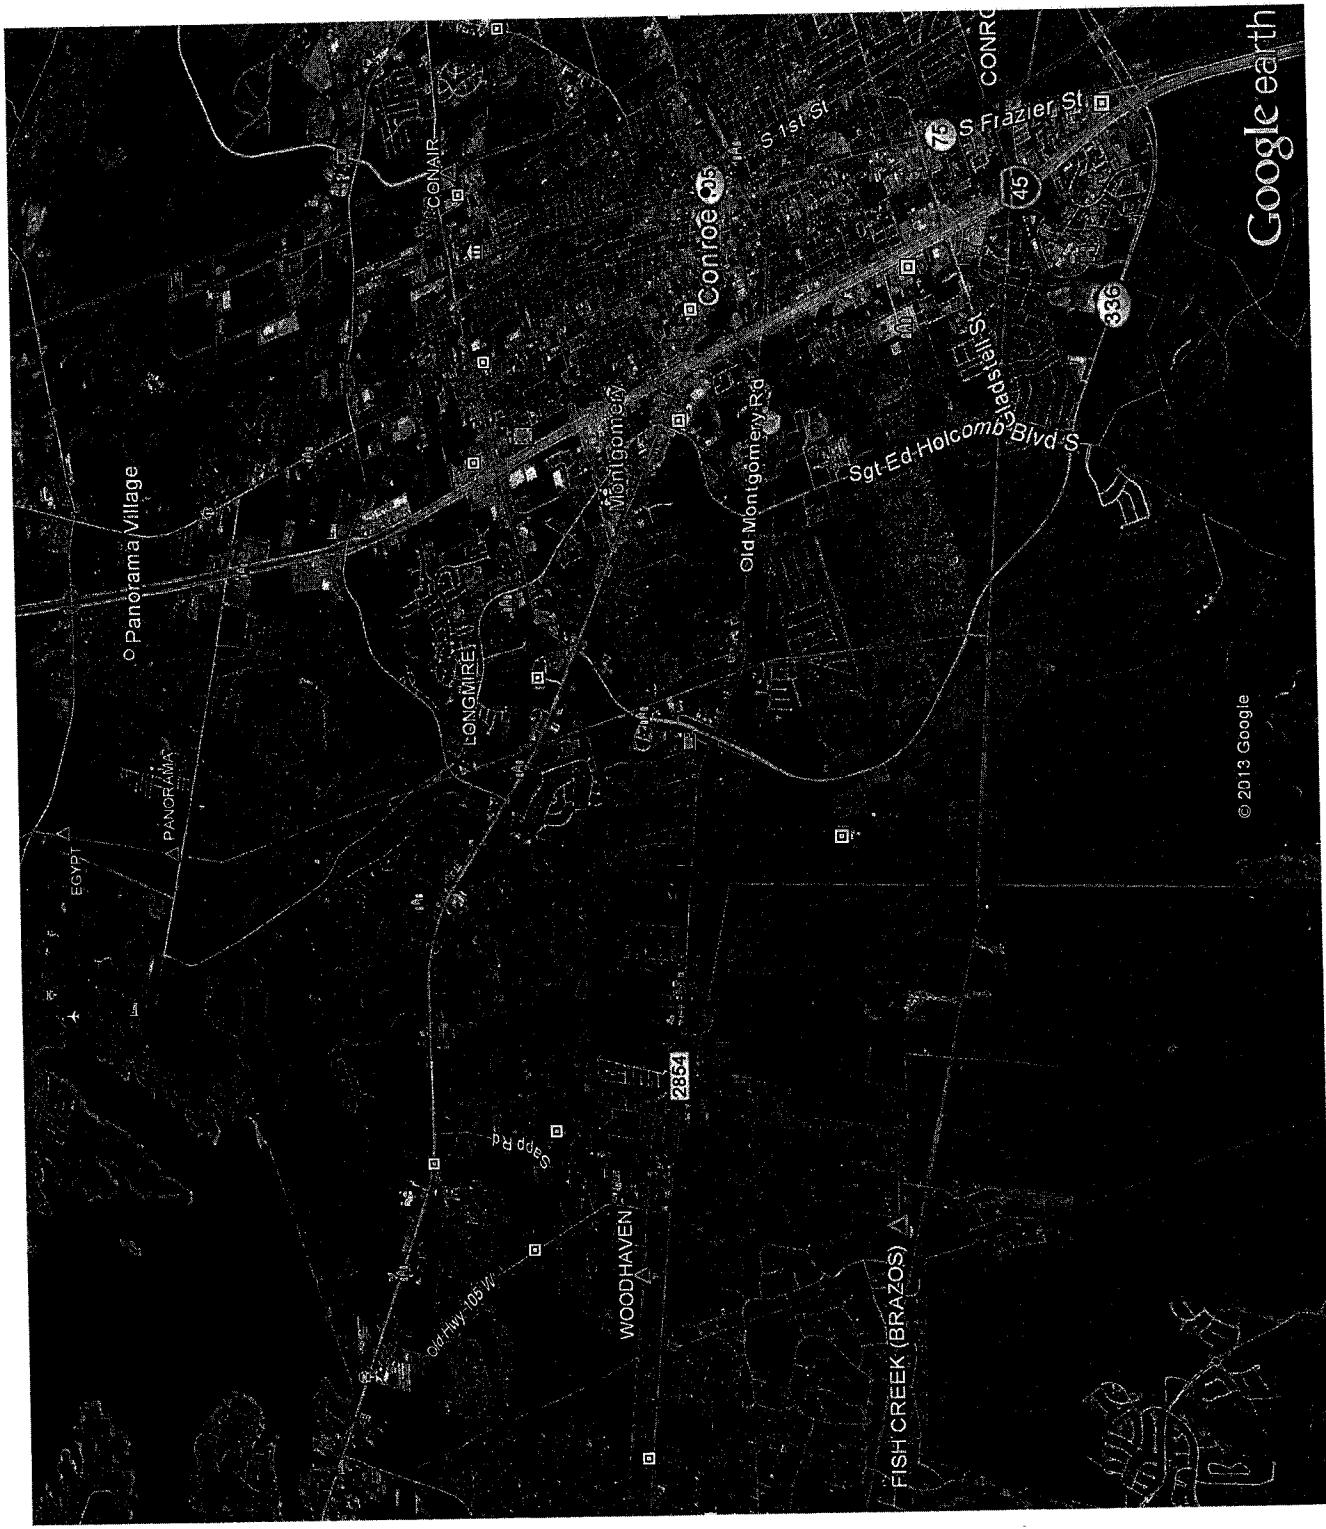

In addition, the Company determined that the negotiated price per acre for the land at issue was reasonable in light of the suitable alternatives. During the scoping phase of the Ponderosa Switching Station project, the project team identified three candidate properties for the Ponderosa Switching Station, following which ETI’s right-of-way agents entered into negotiations with the respective landowners. The first landowner was willing to sell his property for \$44,000/acre, the second for \$25,000/acre, and the third for approximately \$10,500/acre. All three properties’ per unit cost fell within the range identified by the Company’s market analysis. The Company ultimately purchased the third and least expensive tract. In addition to having a lower cost per acre, the third tract provided east and west access from major roadways, provided additional acreage for a proposed future 230 kV substation, better enabled the Company to handle site drainage and runoff issues, and reduced the impact that the switching station and proposed substation facilities would have on the surrounding public due to there being sufficient land to allow for a perimeter green zone. Furthermore, as shown in the attached map, the Longmire-to-Fish Creek 138 kV line that was cut in to the switching station runs directly through the tract; and, the Conroe-to-Woodhaven 138 kV line, which was also cut in to the switching station, is located less than one mile to the south. Accordingly, in valuing and purchasing the third

Question No.: STAFF 23-3

tract, the Company considered the potential additional costs associated with purchasing a different tract in a less suitable location and having to extend or construct facilities to reach the less suitable tract.

Finally, the price of the purchased tract reflects that it is located in an area experiencing residential development, and is bounded on both the north and the south sides by subdivisions, as shown in the attached map. Considering the negotiations with the other landowners, the flexibility provided by the 143-acre tract, the Company's market analysis, the potential for residential development of the tract, and the experience of the Company's right-of-way agents, ETI determined that the price ultimately paid for the third tract was reasonable.

- f. The Company notes that the referenced appraisal reflects only the tax-appraised timber market value of the subject tract, and does not necessarily reflect what would be paid if the property were purchased in an arms-length transaction. Additionally, the referenced appraisal does not reflect the considerations summarized above in the Company's response to subpart (e), including: the cost of comparable, suitable alternatives; the value of the property for ETI's utility-specific use; or the avoided costs to ETI associated with purchasing a less suitable tract.

Question No.: STAFF 23-4

Part No.:

Addendum:

Question:

Please refer to Schedule C-4.1 regarding ETI electric CWIP by functional group at March 31, 2013. Please provide a similar spreadsheet as was provided and in MS Excel format, but provide the following additional information:

- a. Identify projects that have been completed along with the actual completion date.
  - b. Completion percentage for projects that are not complete.
  - c. Identify projects that have been abandoned or forfeited.
  - d. Clearly identify which projects are new construction projects and which are upgrade/rebuild projects.
  - e. Identify the projects and the dollar amount of each project that ETI is requesting to be included in rate base to earn a return and provide the FERC account.
- 

Response:

- a. See the attached spreadsheet, which includes the requested CWIP projects, each project's current status, and for completed projects, the project's completion date.
- b. The attached spreadsheet contains the requested completion percentages for projects in CWIP which have not been completed. Blanket projects and capital suspense projects are not closed as part of the Company's accounting procedures and are indicated in the attachment as, "Blanket" for blanket projects and "Alloc Pool" for capital suspense projects.
- c. The attached spreadsheet contains the projects included in CWIP which were abandoned or forfeited. Abandoned or forfeited projects are indicated as "cancelled" in the attachment.
- d. The attached spreadsheet contains identification of CWIP projects as either Upgrade or Rebuild projects.
- e. ETI is not requesting CWIP in rate base.

## Attachment to Staff 23-4

Business Unit	Account	Project	Project name	Completion Date	Percent Complete	Upgrade/Rebuild	Utility Account	CWIP Amount at 03/31/2013
