Hi. We're all hoping that work is being done to fortify the grid so that it can handle extreme weather conditions. Especially since there are so many unpredictable weather incidents happening all over the world. So yeah, extreme heat and extreme cold. But also I think you should consider SOLAR FLARES. There was an even in the 1800s where a solar flare blew out all the telegraph stations. So maybe some extra grounding tech would be a good idea. Just to make sure a huge surge of energy doesn't blow out everything.

Thanks,

Joe
