A complete plan to meet peak electricity demand must **include a financial incentive for homeowners to install solar panels.**

The best incentive is high rates in the afternoons and low rates at night. For example, if the afternoon rates were doubled, the financial benefit of a solar installation would double, and the relief to the grid would double. Plus, lower costs at night would incentivize charging our EVs at night.

Permitting this freedom to choose will cost the state of Texas nothing.

All that is required is to allow Time-of-Use retail rates. In the case of public utilities, the PUC should require that they offer a TOU rate schedule.
